

Significant differences in consumer prices across Europe

Comparative price levels in 37 European countries for 2010

Price levels for consumer goods and services in 2010 differed widely across Europe: in Denmark consumer prices were 43% higher than the average of the 27 EU Member States, while in the former Yugoslav Republic of Macedonia prices were 56% lower than this average. Among the EU Member States, the cheapest country was Bulgaria (49% below the average).

These are the main results of price surveys covering around 2500 consumer goods and services across 37 European countries. Those surveys are part of the Eurostat-OECD Purchasing Power Parities (PPP) programme (see methodological notes).

The 37 countries that participate in this programme are the 27 Member States, three EFTA countries (Iceland, Norway and Switzerland), four Candidate Countries (Montenegro, Croatia, the former Yugoslav Republic of Macedonia and Turkey) and three Western Balkan countries (Albania, Bosnia and Herzegovina and Serbia).

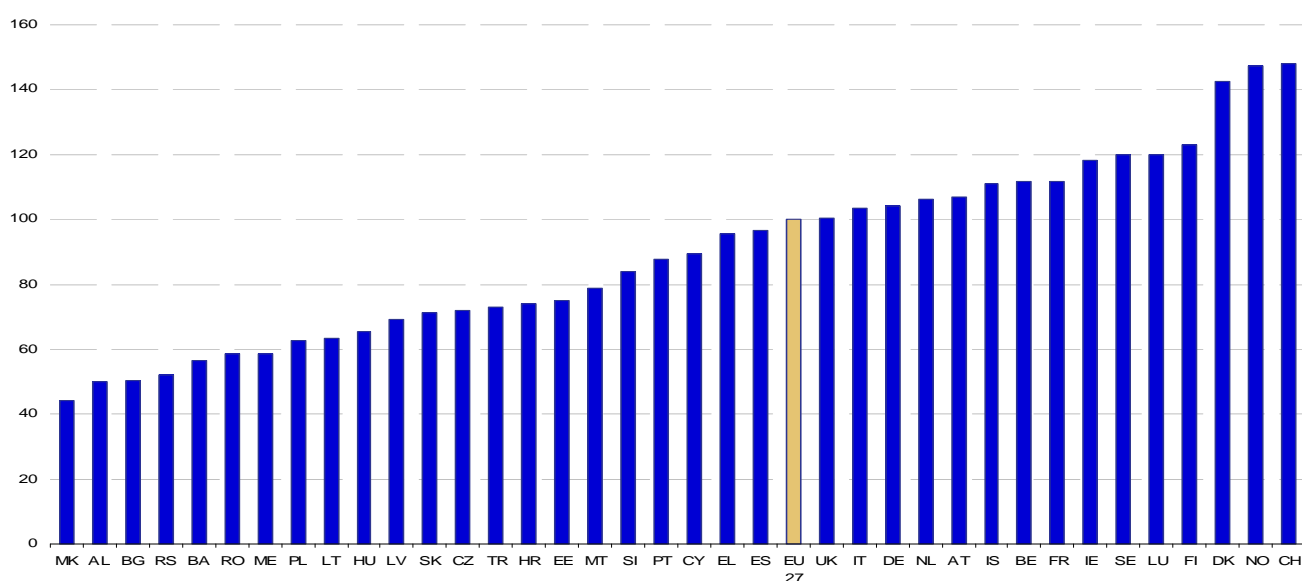

The results of the surveys are expressed in "price level indices" (PLIs), which provide a comparison of countries' price levels with respect to the European

Union average: if the price level index is higher than 100, the country concerned is relatively expensive compared to the EU average and conversely, if the price level index is lower than 100, then the country is relatively cheap compared with the EU average.

Figure 1 shows the 2010 PLIs for total household final consumption expenditure (HFCE) on goods and services. Switzerland and Northern European countries tend to have the highest prices while south-eastern European countries have the lowest prices.

On the following pages, PLIs are shown for a (non-exhaustive) selection of consumer goods and services.

Figure 1: Price level index for household final consumption expenditure (HFCE), 2010, EU27=100

For the country codes, please refer to the methodological notes

All 37	31.6	24.9	38.9	14.9	15.8

Source: Eurostat (online data code : [prc_ppp_ind](#))

Table 1 shows the PLIs for four important groups of consumer goods and services: food and non-alcoholic beverages; alcoholic beverages and tobacco; clothing and footwear (see Box 2 for a description of the content of each product group). These groups represent on average 20%, 5%, 4% and 1% of household expenditure, respectively. For reference, the PLIs of total HFCE (those of figure 1) are also shown.

The shaded fields indicate the highest and lowest PLIs per product group among all 37 participating countries. The highest and lowest PLIs among the 27 EU Member States are marked in bold.

At the bottom of the table, variation coefficients are provided for the euro area (EA16), EU15 Member States, the European Union (EU27) and the group of all countries participating in the programme (All 37). The variation coefficient is defined as the standard deviation of the PLIs of the respective group of countries as percentage of their average PLI. The higher the variation coefficient, the higher is the price dispersion in the respective product group.

Norway is consistently the most expensive country of all 37, for all four product groups. Amongst the Member States, Denmark is the most expensive for food and non-alcoholic beverages and Ireland has the highest PLI for alcoholic beverages and tobacco. Sweden reports the highest prices among the Member States for clothing and Finland for footwear.

The former Yugoslav Republic of Macedonia is the least expensive country of all 37 for food, beverages and tobacco as well for the alcoholic beverages, while Turkey is the cheapest of the participating countries for clothing and footwear. Within the EU Member States Bulgaria is the least expensive country for all four product categories.

Of these four product groups, the highest price dispersion is found for alcoholic beverages and tobacco. This is mainly due to large differences in taxation on these products across the 37 countries. Much less dispersion is apparent in the prices of clothing and footwear.

Price dispersion is naturally greatest within the 37-country group, including both the high price EFTA countries and the (mostly) low price Candidate Countries and Western Balkan Countries.

Energy, furniture, household appliances and consumer electronics

Source: Eurostat (online data code: [prc_ppp_ind](#))

Table 2 shows the PLIs for another four groups of goods and services: energy (electricity, gas and other fuels); furniture; household appliances and consumer electronics (see Box 2 for a description of the content of these groups). These groups represent on average 5%, 2%, 1% and 1% of household final consumption expenditure, respectively.

Price dispersion varies significantly between these four product groups, being most pronounced for electricity, gas and other fuels. Here, Denmark is by far the most expensive of all 37 participating countries, while Serbia is the least expensive, with Romania being the cheapest EU Member State.

Price dispersion is much lower for the other three categories shown in this table. The lowest price dispersion in general is found for consumer electronics.

Malta shows the highest price levels of all 37 countries for furniture and furnishings and household appliances. This may be due to the geographical position of Malta (leading to higher transportation costs) and the small size of Malta's internal market.

Romania shows the lowest price levels of the EU Member States for all product groups except for consumer electronics. Bulgaria is the least expensive country of all 37 for consumer electronics.

Among all 37 countries, Bosnia and Herzegovina has the lowest prices for furniture, while the former Yugoslav Republic of Macedonia is the cheapest for household appliances.

Personal transport equipment, transport services, communication, restaurants and hotels

Source: Eurostat (online data code : [prc_ppp_ind](#))

Table 3 shows the PLIs for another four groups of goods and services: personal transport equipment; transport services; communication (services and equipment); and restaurants and hotels. These groups represent on average 3%, 3%, 3% and 8% of household final consumption expenditure, respectively.

Price dispersion for personal transport equipment is not very significant and Denmark and Norway stand out with very high PLI for this category. This is due to high taxation levels on cars in these countries. The lowest prices are found in Montenegro and Serbia, but these are only 15% below the EU average, demonstrating the relative closeness of prices for personal transport equipment among the other 36 countries.

Price dispersion is significantly higher among the two service categories (transport services and restaurants and hotels). Prices for services generally tend to show larger differences across countries than prices for goods, due to the higher share of labour input into services and the high dispersion of wages across countries.

Concerning transport services, Norway and Malta show the highest PLIs among all countries and among EU Member States respectively. The lowest PLI levels are observed in Bulgaria among the Member States and the former Yugoslav Republic of Macedonia among all countries.

The highest and lowest PLIs for communication can be observed in Spain and Serbia among all countries, where Cyprus is the cheapest EU Member State.

Finally, Norway and Denmark stand out with the most expensive restaurants and hotels, while the lowest prices for these services are observed in the former Yugoslav Republic of Macedonia, Albania and Bulgaria.

Box 1: Data sources

Within the framework of the Eurostat-OECD Purchasing Power Parities (PPP) program, surveys on prices of household goods and services are carried out cyclically by the National Statistical Institutes (NSIs) of 37 countries: the 27 EU Member States, 3 EFTA countries (Iceland, Norway and Switzerland), 4 Candidate Countries (Montenegro, Croatia, the former Yugoslav Republic of Macedonia and Turkey) and 3 Western Balkan countries (Albania, Bosnia and Herzegovina and Serbia).

Each survey cycle comprises 6 surveys, each related to a particular group of household consumption products. As 2 surveys are run per year, the whole survey cycle takes 3 years to conclude, before the next cycle starts. The prices used for this publication are therefore collected in 2008, 2009 and 2010. The prices collected in 2008 and 2009 are updated to 2010 using detailed consumer price indices. The PLIs presented in this article are based on annual national average prices for in total about 2500 goods and services.

The expenditure shares reported in this article are based on national accounts data for 2009 and represent the average over all participating countries. The national accounts data are also used as weights in the aggregation of detailed PLIs to aggregate PLIs such as for Household Final Consumption Expenditure (HFCE).

Price convergence

Figure 2 shows the development over time of the variation coefficient of the PLI for total household final consumption expenditure for four country groups. A decrease of the variation coefficient is an indication of price convergence. It can be seen that between 1995 and 2010 there was a clear decrease of the variation coefficient for the group of 27 Member States, however since 2008 there has been a slight increase in the indicator. The variation coefficient is

fairly stable for the group of EU15 Member States. For the euro area, the variation coefficient decreased in the early years, then was relatively stable between 1999 and 2003, but has been decreasing since 2004. Data for the group of all 37 countries are only available from 2005 onwards, but give an indication of a slight price divergence since 2008. This can however be partly explained by the impact of fluctuations in exchange rates.

Figure 2: Price convergence - variation coefficient of price level indices of final household consumption expenditure

Source: Eurostat (online data code: [prc_ppp_ind](#))

Box 2: The impact of exchange rates changes on PLIs

As explained in the methodological notes, the PLI for a given country is calculated as its purchasing power parity (PPP) divided by its annual average exchange rate to the euro. This implies that exchange rate movements have an impact on the PLIs. An appreciation of a country's currency against the euro will make the country more expensive in comparison to euro area countries and this will show as an increase of the relative price level expressed in the PLI.

In 2010, several countries experienced relatively large exchange rate movements. The most significant examples are Sweden, Switzerland and Norway (appreciation of 11%, 9% and 9% respectively between 2009 and 2010). This explains in part some changes in the position of countries in PLIs compared with previously published data for 2009.

Box 3: Description of the product groups

The product groups presented in the article include the following types of products:

Food and non-alcoholic beverages: bread and cereals, meat, fish, milk, cheese, eggs, oils and fats, fruits, vegetables, potatoes, other food, non-alcoholic beverages

Alcoholic beverages and tobacco: spirits, wine, beer, tobacco and narcotics

Clothing: clothing materials, men's, women's, children's and infant's clothing, other articles of clothing and clothing accessories. Excludes cleaning, repair and hire of clothing.

Footwear: men's, women's, children's and infant's footwear. Excludes repair and hire of footwear.

Electricity, gas and other fuels: electricity, gas, liquid fuels, solid fuels and heat energy (all for domestic use)

Furniture and furnishing, carpets and other floor coverings: kitchen furniture, bedroom furniture, living-room and dining-room furniture, other furniture and furnishings, carpets and other floor coverings. Excludes repair of furniture, furnishings and floor coverings.

Household appliances: for example: refrigerators and freezers, washing machines, dishwashers, cookers, microwave ovens, vacuum cleaners, coffee makers, kettles, toasters, etc. Excludes repair of household appliances.

Consumer electronics: for example: televisions, DVD players, receivers, audio systems, MP3 players, cameras, camcorders, desktop and laptop computers, monitors, printers, scanners, software, music CDs, movie DVDs, empty CDs and DVDs. Excludes repair of such equipment.

Personal transport equipment: motor cars, motor cycles and bicycles. Excludes maintenance and repair of personal transport equipment, spare parts and fuels.

Transport services: passenger transport by railway, by road, by air, by sea and inland waterway, and other purchased transport services (e.g. left luggage services, removal services)

Communication: postal services, telephone and telefax equipment, telephone and telefax services

METHODOLOGICAL NOTES

The data in this publication are produced by the Eurostat-OECD Purchasing Power Parity (PPP) programme. The full methodology used in the programme is described in the Eurostat-OECD Methodological manual on purchasing power parities which is available free of charge from the Eurostat website.

In their simplest form PPPs are nothing more than price relatives that show the ratio of the prices in national currencies of the same good or service in different countries.

For example, if the price of a hamburger in France is 2.84 euros and in the United Kingdom it is 2.20 pounds sterling, the PPP for hamburgers between France and the United Kingdom is 2.84 euros to 2.20 pounds or 1.29 euros to the pound. In other words, for every pound spent on hamburgers in the United Kingdom, 1.29 euros would have to be spent in France in order to obtain the same quantity and quality – or volume – of hamburgers.

Comparative price levels as presented in this publication are the ratios of PPPs to exchange rates. They provide a measure of the differences in price levels between countries by indicating for a given product group the number of units of common currency needed to buy the same volume of the product group or aggregate in each country.

Price level indices (PLIs) provide a comparison of the countries' price levels with respect to the European Union average: if the price level index is higher than 100, the country concerned is relatively expensive compared to the EU average and vice versa. The EU average is calculated as the weighted average of the national PLIs, weighted with the expenditures corrected for price level differences. Price level indices are not intended to rank countries strictly. In fact, they only provide an indication of the order of magnitude of the price level in one country in relation to others, particularly when countries are clustered around a very narrow range of outcomes. The degree of uncertainty associated with the basic price data and the methods used for compiling PPPs, may affect in such a case the minor differences between the PLIs and result in differences in ranking which are not statistically or economically significant.

The main use of PPPs is to convert expenditures (including GDP) of different countries into real expenditures (and real GDP). Real expenditures are valued at a uniform price level and so reflect only differences in the volumes purchased in countries. PPP and real expenditures provide the price and volume measures required for international comparisons.
