Introduction

This first edition of **Key Data on Health** responds to the growing demand of EU health policy for a comprehensive, consistent and internationally comparable set of health data and indicators, highlighted in the programme of Community Action on Health Monitoring; this programme was adopted by the European Parliament and the Council on 30th of June 1997 in the framework for action in the field of public health.

A strong feature of this report is the fact that Eurostat brings together information on a wide range of health topics from the most relevant data-sources available around the world: New Cronos of Eurostat, Ecosante from OECD, Health for All from WHO, FAO, International Agency for Cancer, AIDS Surveillance Centre, specific epidemiological studies, etc.

Information on the Health Status of the population and the description of Health Care systems is at the core of this publication; however, **Key Data on Health** also addresses the issues of *life styles* (nutrition, smoking, drinking, sexual behaviour and AIDS risk, physical activity, drug use), *mortality* (infant, causes of death) and *health risks* associated with environment, work, leisure and traffic.

Key Data on Health covers the 15 EU Member States, as well as Iceland, Norway, Liechtenstein and Switzerland. Tables and graphs provide, where possible, data from 1960 onwards disaggregated by gender and age.

Eurostat considers this publication to be a first step in the long process of building a comprehensive statistical information system on Health and Safety, within the main body of socio-economic statistics. Our objective is to make **Key Data on Health** a valuable tool for EU health policy planners, the medical community, health economists and researchers, the media and the public at large.

Luxembourg, May 2000

This publication has been prepared by the Sector 'Health and Safety', of Unit E3
(Education, health and other social domains) of Eurostat.

Content: Antoni Montserrat Moliner supported by Marleen De Smedt, Jacques Bonte,
Didier Dupré and Nassima Hamzaoui (Eurostat E-3), other staff members of Eurostat and by
colleagues in other Commission services.

There was also support from LEG Health partners
and from Rob Stones (Department of Health – UK) and Liz Kirby (ONS-UK).

© MEGRIN GIE 1999, for the administrative boundaries, on behalf of the national
organisations responsible for official mapping of the displayed countries.

2.2.5	Abb.	Körperliche Betätigung am Arbeitsplatz (% sitzend verbrachter Stunden) – 1997	HFS

3. Rauchen

2.3.1	Tabelle	Anteil der Bevölkerung, der täglich Zigaretten raucht, nach Alter und Geschlecht – 1995	Eurobarom
2.3.2	Tabelle	Prävalenz des Rauchens (1970, 1980, 1990) nach Land und Geschlecht (in %)	St. Sweden
2.3.3	Tabelle	Prävalenz des Rauchens nach Geschlecht und Altersgruppe (% der Bevölkerung) – 1994/1998 (einschließlich gelegentlicher Raucher sowie mit bereinigten geschlechtsspezifischen Unterschieden zwischen den Altersgruppen)	Eurostat
2.3.4	Tabelle	Anzahl der pro Tag und Raucher gerauchten Zigaretten nach Geschlecht (in %) – 1995	Eurobarom
2.3.5	Tabelle	Durchschnittliche Anzahl der pro Person und Jahr auf dem Markt verfügbaren Zigaretten	WHO

4. Trinken

2.4.1	Tabelle	Durchschnittliche Menge reinen Alkohols in Litern, die pro Person (über 15 Jahre) und Jahr auf dem Markt verfügbar ist	WHO
2.4.2	Abb.	Anteil der Jungen und Mädchen, die zugeben, mindestens einmal pro Woche Alkohol zu trinken, 1997-98, in mehreren Mitgliedstaaten	HBSC-WHO

5. Drogenkonsum

2.5.1	Tabelle	Lebenslange Prävalenz des Drogenkonsums in neueren landesweiten Erhebungen unter der allgemeinen Bevölkerung	EBDD
2.5.2	Tabelle	Einige Merkmale von Patienten, die in verschiedenen EU-Staaten aufgrund von Drogenproblemen in Behandlung sind	EBDD
2.5.3	Abb.	Drogenkonsum von 15- bis 16jährigen Schülern (auch einmaliger Konsum)	EBDD

6. Sexualverhalten und AIDS-Risiko

2.6.1	Tabelle	Sexualleben: Anzahl der Partner während der letzten 12 Monate; Verwendung von Kondomen; Alter beim ersten Geschlechtsverkehr; Häufigkeit von Geschlechtsverkehr	FUSL
2.6.2	Tabelle	Fruchtbarkeitsrate, Lebendgeburten je 1.000 Frauen bei Mädchen unter 19 Jahren	Eurostat

2.6.3	Tabelle	Gesamtzahl legaler Schwangerschaftsabbrüche bei Mädchen unter 20 Jahren	Eurostat
2.6.4	Tabelle	Einstellung zu persönlichen Vorkehrungen gegen das Risiko einer AIDS-Infektion (1990-1995)	Eurobarom
2.6.5	Tabelle	Wissen über persönliche Verhaltensweisen in bezug auf das Risiko einer AIDS-Infektion (1990-1995)	Eurobarom

7. Andere Faktoren der Lebensweise

2.7.1	Tabelle	Anzahl der Expositionen gegenüber künstlichen UV-Strahlen (Solarien) durch Europäer - 1997	Eurobarom
-------	---------	--	-----------

3. RISIKEN IN ZUSAMMENHANG MIT UMWELT, ARBEITSBEDINGUNGEN, FREIZEIT UND VERKEHR

1. Umwelt

3.1.1	Tabelle	Emission von Schwefeloxiden (SO _x) in kg pro Kopf	Eurostat
3.1.2	Tabelle	Emission von Stickstoffoxiden (No _x) in kg pro Kopf	Eurostat
3.1.3	Tabelle	Emission von Kohlenstoffdioxid (CO ₂) aus der Verbrennung fossiler Brennstoffe in kg pro Kopf	Eurostat
3.1.4	Tabelle	Emission von flüchtigen organischen Verbindungen außer Methan (NMVOC) in kg pro Kopf	Eurostat
3.1.5	Tabelle	Gewichtete Freisetzung von Schwermetallen in die Luft in As-TEQ	Öko-Inst.
3.1.6	Tabelle	Unbehandelte Haushaltsabwässer (in m ³ pro Kopf)	TAU
3.1.7	Abb.	Anteil der an die Kanalisation angeschlossenen Bevölkerung –1990	Eurostat
3.1.8	Abb.	Lärmbelastung durch Straßenverkehr - Anfang der 80er und 90er Jahre. Anteil der Bevölkerung mit einer Exposition L _{aeq} > 65 dB (A), 24 Stunden	OECD

2. Arbeitsbedingungen

3.2.1	Tabelle	Arbeitsunfälle im Jahr 1996. Standardisierte Inzidenzrate (9 Branchen)	Eurostat
3.2.2	Tabelle	Arbeitsunfälle in der EU 1996 nach Geschlecht	Eurostat
3.2.3	Tabelle	Arbeitsunfälle in der EU 1996 nach Geschlecht und verletztem Körperteil	Eurostat
3.2.4	Tabelle	Arbeitsunfälle in der EU 1994 nach Wirtschaftszweig (9 Branchen)	Eurostat

3. Haus- und Freizeitunfälle

3.3.1	Abb.	Geschätzte Freizeit- und Hausunfälle nach Unfallort (% der Verteilung) - EU-15 – 1995	EHLASS
3.3.2	Tabelle	Geschätzte Freizeit- und Hausunfälle nach Alter und Unfallort (% der Verteilung) - EU-15 – 1995	EHLASS
3.3.3	Abb.	Geschätzte Freizeit- und Hausunfälle nach Aktivität (% der Verteilung) – EU-15 – 1995	EHLASS
3.3.4	Tabelle	Geschätzte Freizeit- und Hausunfälle nach Alter und Aktivität (% der Verteilung) - EU-15 – 1995	EHLASS
3.3.5	Abb.	Geschätzte Freizeit- und Hausunfälle nach Verletzungsart (% der Verteilung) - EU-15 – 1995	EHLASS
3.3.6	Tabelle	Geschätzte Freizeit- und Hausunfälle nach Alter und Verletzungsart (% der Verteilung) - EU-15 – 1995	EHLASS

4. Verkehrsunfälle

3.4.1	Tabelle	Verletzte bei Straßenverkehrsunfällen je 100.000 Einwohner	WHO
3.4.2	GISCO	Anzahl der Todesfälle je 1 Million Einwohner in den Regionen der EU – 1996	Eurostat

4. GESUNDHEITZUSTAND

1. Eigene Einschätzung und Messung der Gesundheit

4.1.1	Tabelle	Selbsteinschätzung der Gesundheit (Personen im Alter von 16+) nach Geschlecht – 1994	Eurostat
4.1.2	Tabelle	Selbsteinschätzung der Gesundheit (Personen im Alter von 16+) nach sozioökonomischen Unterschieden – 1994	Eurostat
4.1.3	Abb.	Einschätzung der Gesundheit als „(sehr) schlecht“ nach Bildungsniveau (standardisiert) – 1994	Eurostat
4.1.4	Tabelle	Durchschnittsgewicht der Europäer nach Alter und Geschlecht – 1996	Eurobarom
4.1.5	Tabelle	Durchschnittsgröße der Europäer nach Alter und Geschlecht – 1996	Eurobarom
4.1.6	Tabelle	Body Mass Index (BMI) nach Geschlecht – 1996 (Prozentverteilung der Bevölkerung, alle Altersgruppen)	Eurobarom

2. Zahngesundheit

4.2.1	Tabelle	Zufriedenheit mit den eigenen Zähnen, Zahnprothesen oder dritten Zähnen nach Geschlecht – 1996	Eurobarom
4.2.2	Abb.	Zufriedenheit („sehr“ und „ziemlich“) mit den eigenen Zähnen, Zahnprothesen oder dritten Zähnen nach Alter und Geschlecht – EU-15 - 1996	Eurobarom
4.2.3	Abb.	Schüler (11-13 Jahre), die öfter als einmal täglich Zähneputzen (%) – 1997/98	HBSC-WHO
4.2.4	Tabelle	DMFT-Index für 12jährige (kariöse, gefüllte, fehlende Zähne)	WHO

3. Behinderungen und Einschränkungen

4.3.1	Tabelle	Einschränkung bei alltäglichen Aktivitäten durch chronische Beschwerden nach Geschlecht (Personen im Alter von 16+) – 1994	Eurostat
4.3.2	Tabelle	Reduzierung von Aktivitäten aus physischen und/oder psychischen Gründen (Personen im Alter von 16+) – 1994	Eurostat
4.3.3	Tabelle	Behinderungsfreie Lebenserwartung nach Geschlecht – 1994	REVES
4.3.4	Abb.	Schätzung des Behindertenanteils – 1992	Eurostat
4.3.5	Abb.	Schätzung der Behinderten, die in Verbindung mit einer Behinderung finanzielle Unterstützung erhalten – 1991	Eurostat
4.3.6	Abb.	Behinderte nach dem Grad der Behinderung – 1992	Eurostat
4.3.7	Abb.	Sehbehinderte insgesamt – 1994 (je 100.000 Einwohner)	EBU
4.3.8	Tabelle	Anteil der Personen, die eine permanente Arbeitsunfähigkeit angeben, an der Gesamtbevölkerung nach Geschlecht – 1997	Eurostat

4. Krankheitsspezifische Morbidität

4.4.1	Tabelle	Inzidenz von Krebsarten 1990-1995. Altersstandardisierte Rate je 100.000 Männer (Standardweltbevölkerung)	IARC
4.4.2	Tabelle	Inzidenz von Krebsarten 1990-1995. Altersstandardisierte Rate je 100.000 Frauen (Standardweltbevölkerung)	IARC
4.4.3	Abb.	Anteil bestimmter Krebsarten an allen Krebsfällen — Männer, Frauen –1995	IARC
4.4.4	Tabelle	Schätzung der Krebsinzidenz im Jahr 1995 sowie der ein- und fünfjährigen Prävalenz in absoluten Zahlen	IARC
4.4.5	Tabelle	Altersstandardisierte fünfjährige relative Überlebensrate (%) erwachsener Krebspatienten (im Alter von 15+) in Europa nach Geschlecht und Land – 1985-1989	EUROCORE
4.4.6	Tabelle	AIDS-Inzidenzraten je 1 Million Einwohner nach Jahr der Diagnose mit Bereinigung der verzögerten Meldungen	CESES
4.4.7	Tabelle	Neue AIDS-Fälle nach Jahr der Diagnose	CESES

4.4.8	Tabelle	AIDS-Fälle nach Altersgruppe (% der kumulativen Summe)	CESES
4.4.9	Abb.	Kumulative AIDS-Fälle nach Übertragungsgruppe. Personen im Alter von 13+, Meldung bis 31. Dezember 1998	CESES
4.4.10	Abb.	Kumulative pädiatrische AIDS-Fälle. Kinder unter 1 Jahr, Meldung bis 31. Dezember 1998 (% aller Fälle).	CESES
4.4.11	Abb.	Anteil der mit HIV-2 Infizierten an den kumulativen AIDS-Fällen per 31.12.1998	CESES
4.4.12	Tabelle	HIV-Meldungen 1998	CESES
4.4.13	Tabelle	Systematische Untersuchungen auf HIV-Antikörper in Blutbanken: HIV-Prävalenz in Blutspenden nach Land	CESES
4.4.14	Tabelle	Inzidenz der Tuberkulose insgesamt je 100.000 Einwohner	EuroTB
4.4.15	Abb.	Tuberkulosemeldungsrate (%) nach Geschlecht (Diagnose 1996)	EuroTB
4.4.16	Abb.	Verbundene klinisch-virologische Überwachung für Grippe in Europa — 1997/98 und 1999/2000	Flu-Net
4.4.17	Tabelle	Inzidenz von Hepatitis B insgesamt je 100.000 Einwohner	WHO
4.4.18	Tabelle	Inzidenz von Malaria insgesamt je 100.000 Einwohner	WHO
4.4.19	Tabelle	Inzidenz von durch eine empfohlene Impfung vermeidbarer Krankheiten insgesamt je 100.000 Einwohner, 1995-1997	WHO
4.4.20	Tabelle	Inzidenz von Syphilis insgesamt je 100.000 Einwohner	WHO
4.4.21	Tabelle	Inzidenz von Gonokokkeninfektionen insgesamt je 100.000 Einwohner	WHO
4.4.22	Abb.	Verteilung gemeldeter Fälle von sexuell übertragbaren Krankheiten, Italien 1991-1996.	EuroSurveillance
4.4.23	Abb.	Prävalenz des Hepatitis-C-Virus (HCV) (in % der Bevölkerung) nach Land, 1997	WHO
4.4.24	Tabelle	Creutzfeld-Jakob-Krankheit: bestätigte und vermutete Fälle pro Jahr der Diagnose	
4.4.25	Tabelle	Prävalenzrate (je 10.000 Geburten) für ausgewählte angeborene Anomalien in den 25 EUROCAT-Registern (insgesamt), 1980-1994	EUROCAT
4.4.26	Tabelle	Prävalenzrate (je 10.000 Geburten) für ausgewählte angeborene Anomalien nach EUROCAT-Register, 1980-1994	EUROCAT
4.4.27	Abb.	Relative Häufigkeit (in %) nach ausgewählten angeborenen Anomalien, 1980-1994	EUROCAT
4.4.28	Tabelle	Anerkannte Berufskrankheiten in der EU. Inzidenz je 1 Million nach NACE-Wirtschaftszweigen – 1995	Eurostat
4.4.29	Abb.	Anerkannte Berufskrankheiten in EU-15. Anteil aller Fälle – 1995	Eurostat
4.4.30	Tabelle	Inzidenz von Hüftfrakturen in Verbindung mit Osteoporose je 10.000 nach Alter und Geschlecht	
4.4.31	Tabelle	Prävalenz von Wirbelbrüchen in Verbindung mit Osteoporose je 10.000 nach Alter und Geschlecht	
4.4.32	Abb.	Altersstandardisierte Myokardinfarktinzidenzraten 100.000 (Altersgruppe 35-64) und Fatalitätsraten innerhalb von 28 Tagen	MONICA
4.4.33	Abb.	Schätzung der Diabetesprävalenz. Rohe Ziffern je 1 Million – 1994	IDI/WHO
4.4.34	Tabelle	Schätzung der absoluten Anzahl der Diabetiker (1994) und Projektionen für 2000 und 2010	IDI/WHO
4.4.35	Abb.	Schätzung aller Demenz- und Alzheimer-Fälle (je 1.000) bei den über 65jährigen	Alzheimer Europe
4.4.36	Abb.	Geschätzte Prävalenz einiger neurodegenerativer Krankheiten des Alters, nach Alter	EURODEM

5. TODESURSACHEN

1. Säuglingssterblichkeit

5.1.1	Tabelle	Säuglingssterblichkeit	Eurostat
5.1.2	GISCO	Säuglingssterblichkeit nach Region, 1995	Eurostat
5.1.3	Tabelle	Anzahl der Todesfälle bei Kleinkindern (unter einem Jahr)	Eurostat

5.1.4	Abb.	Haupttodesursachen bei Kindern unter einem Jahr, Jungen, EU-15, 1996	Eurostat
5.1.5	Abb.	Haupttodesursachen bei Kindern unter einem Jahr, Mädchen, EU-15, 1996.	Eurostat
5.1.6	Abb.	Sterbeziffer für plötzlichen Kindstod je 10.000 Lebendgeburten im Jahr 1995	Eurostat
5.1.7	Tabelle	Perinatalsterblichkeit	Eurostat
5.1.8	Tabelle	Neonatalsterblichkeit	Eurostat
5.1.9	Tabelle	Frühsterblichkeit	Eurostat
5.1.10	Tabelle	Sterblichkeit für späten Fruchttod	Eurostat
5.1.11	Tabelle	Todesfälle bei Kindern unter 28 Tagen	Eurostat
5.1.12	Tabelle	Todesfälle bei Kindern unter 7 Tagen	Eurostat

2. Mortalität nach Ursache

5.2.1	Tabelle	Standardisierte Sterbeziffer für 65 Todesursachen, Männer, 1996	Eurostat
5.2.2	Tabelle	Standardisierte Sterbeziffer für 65 todesursachen, Frauen, 1996	Eurostat
5.2.3	Abb.	Haupttodesursachen (%), Männer und Frauen, in EU-15 – 1996	Eurostat
5.2.4	Abb.	Todesursachen nach Altersgruppen im Jahr 1996 (EU-15) (in %), Männer	Eurostat
5.2.5	Abb.	Todesursachen nach Altersgruppen im Jahr 1996 (EU-15) (in %), Frauen	Eurostat
5.2.6	Tabelle	Anteil (%) der Todesursachen an den Todesfällen insgesamt in EU-15 – 1996, nach Alter und Geschlecht	Eurostat
5.2.7	Tabelle	Müttersterblichkeit (standardisierte Sterbeziffer), alle Ursachen je 100.000 Lebendgeburten	WHO
5.2.8	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch infektiöse und parasitäre Krankheiten, alle Altersgruppen: Männer je 100.000 Männer	WHO
5.2.9	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch infektiöse und parasitäre Krankheiten, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.10	GISCO	Rohe Sterbeziffer für infektiöse und parasitäre Krankheiten, alle Altersgruppen: 1995 – je 100.000 Einwohner	Eurostat
5.2.11	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch bösartige Neubildungen Krebs, alle Altersgruppen: Männer je 100.000 Männer	WHO
5.2.12	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch bösartige Neubildungen Krebs, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.13	GISCO	Rohe Sterbeziffer, alle Altersgruppen: 1995 – je 100.000 Einwohner	Eurostat
5.2.14	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Gebärmutterhalskrebs, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.15	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Brustkrebs, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.16	GISCO	Rohe Sterbeziffer für Brustkrebs, alle Altersgruppen: 1995 – je 100.000 Einwohner	Eurostat
5.2.17	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Luftröhren-, Bronchial- und Lungenkrebs, alle Altersgruppen: Männer je 100.000 Männer	WHO
5.2.18	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Luftröhren-, Bronchial- und Lungenkrebs, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.19	GISCO	Rohe Sterbeziffer für Luftröhren-, Bronchial- und Lungenkrebs, alle Altersgruppen: 1995 – je 100.000 Einwohner	Eurostat

5.2.20	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Diabetes mellitus, alle Altersgruppen: Männer je 100.000 Männer	WHO
5.2.21	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Diabetes mellitus, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.22	GISCO	Rohe Sterbeziffer für Diabetes mellitus, alle Altersgruppen: 1995 – je 100.000 Einwohner	Eurostat
5.2.23	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch ischämische Herzerkrankungen, alle Altersgruppen: Männer je 100.000 Männer	WHO
5.2.24	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch ischämische Herzerkrankungen, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.25	GISCO	Rohe Sterbeziffer für ischämische Herzerkrankungen, alle Altersgruppen: 1995 – je 100.000 Einwohner	Eurostat
5.2.26	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch zerebrovaskuläre Krankheiten, alle Altersgruppen: Männer je 100.000 Männer	WHO
5.2.27	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch zerebrovaskuläre Krankheiten, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.28	GISCO	Rohe Sterbeziffer für zerebrovaskuläre Krankheiten, alle Altersgruppen: 1995 – je 100.000 Einwohner	Eurostat
5.2.29	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Atemwegserkrankungen, alle Altersgruppen: Männer je 100.000 Männer	WHO
5.2.30	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Atemwegserkrankungen, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.31	GISCO	Rohe Sterbeziffer für Atemwegserkrankungen, alle Altersgruppen: 1995 – je 100.000 Einwohner	Eurostat
5.2.32	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Selbstmord, alle Altersgruppen: Männer je 100.000 Männer	WHO
5.2.33	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Selbstmord, alle Altersgruppen: Frauen je 100.000 Frauen	WHO
5.2.34	GISCO	Rohe Sterbeziffer für Selbstmord, alle Altersgruppen: 1995 – je 100.000 Einwohner	Eurostat
5.2.35	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Kraftfahrzeugunfälle, alle Altersgruppen: Männer je 100.000 Männer	Eurostat
5.2.36	Tabelle	Todesfälle (standardisierte Sterbeziffer) durch Kraftfahrzeugunfälle, alle Altersgruppen: Frauen je 100.000 Frauen	Eurostat

3. Besondere Todesursachen

5.3.1	Tabelle	Absolute Anzahl der primär durch Alkoholmißbrauch verursachten Todesfälle (einschließlich Alkoholpsychose) nach Alter und Geschlecht — 1996	Eurostat
5.3.2	Tabelle	Anzahl akuter drogenbezogener Todesfälle in den EU-Staaten	EBDD

6. GESUNDHEITSWESEN

1. Humankapital

6.1.1	Tabelle	Beschäftigte im Bereich Gesundheit und Soziales, Männer und Frauen	Eurostat
6.1.2	Tabelle	Anteil der Beschäftigung im Bereich Gesundheit und Soziales an der gesamten Beschäftigung	Eurostat
6.1.3	Tabelle	Anzahl der Ärzte insgesamt	Eurostat
6.1.4	Tabelle	Ärzte je 100.000 Einwohner	Eurostat
6.1.5	GISCO	Ärzte je 1.000 Einwohner – 1995	Eurostat

6.1.6	Tabelle	Ärzte nach Geschlecht (in % aller Ärzte) – 1996	Eurostat
6.1.7	Tabelle	Anteil der Ärzte nach Altersgruppen und Geschlecht für neun EWR-Länder – 1996 (in % aller Ärzte nach Geschlecht)	Eurostat
6.1.8	Tabelle	Fachärzte (absolute Anzahl für ausgewählte Fachgebiete)	Eurostat
6.1.9	Tabelle	Fachärzte (Je 1 Million Einwohner für ausgewählte Fachgebiete)	Eurostat
6.1.10	Tabelle	Anzahl der Zahnärzte insgesamt	Eurostat
6.1.11	Tabelle	Zahnärzte je 100.000 Einwohner	Eurostat
6.1.12	Tabelle	Anzahl der Apotheker insgesamt	Eurostat
6.1.13	Tabelle	Apotheker je 100.000 Einwohner	Eurostat
6.1.14	Tabelle	Anzahl der Krankenpfleger und Hebammen insgesamt	Eurostat
6.1.15	Tabelle	Krankenpfleger und Hebammen je 100.000 Einwohner	Eurostat
6.1.16	Tabelle	Anzahl der Physiotherapeuten insgesamt	Eurostat
6.1.17	Tabelle	Physiotherapeuten je 100.000 Einwohner	Eurostat

2. Einrichtungen und Inanspruchnahme von Leistungen

6.2.1	Abb.	Anteil (%) der geimpften Kinder unter 2 Jahren in EU-Staaten – 1997	CIE/ WHO
6.2.2	Tabelle	Beteiligung der Bevölkerung (%) an allgemeinen Vorbeugungsuntersuchungen, 1996	Eurobarom
6.2.3	Abb.	Beteiligung der Bevölkerung (%) an allgemeinen Vorbeugungsuntersuchungen, nach Alter, EU-15, 1996	Eurobarom
6.2.4	Tabelle	Beteiligung der Frauen (%) an spezifischen Vorbeugungsuntersuchungen, 1996	Eurobarom
6.2.5	Abb.	Beteiligung der Frauen (%) an spezifischen Vorbeugungsuntersuchungen, nach Alter, EU-15, 1996	Eurobarom
6.2.6	Tabelle	Gesamtzahl der Krankenhausbetten (einschließlich psychiatrischer Betten)	Eurostat
6.2.7	Tabelle	Krankenhausbetten (einschließlich psychiatrischer Betten) je 100.000 Einwohner	Eurostat
6.2.8	GISCO	Krankenhausbetten (einschließlich psychiatrischer Betten) je 1.000 Einwohner – 1995	Eurostat
6.2.9	Tabelle	Gesamtzahl psychiatrischer Betten in Krankenhäusern	Eurostat
6.2.10	Tabelle	Psychiatrische Betten in Krankenhäusern je 100.000 Einwohner	Eurostat
6.2.11	Tabelle	Krankenhausaufenthalte in den letzten 12 Monaten (Altersgruppe 16+) – 1994	Eurostat
6.2.12	Abb.	Krankenhausaufenthalte (% der Bevölkerung) in den letzten 12 Monaten nach Alter – 1994 – EU-12	Eurostat
6.2.13	Tabelle	Anzahl der im Krankenhaus verbrachten Nächte in den letzten 12 Monaten, nach Geschlecht – 1996	Eurostat
6.2.14	Tabelle	Anzahl der im Krankenhaus verbrachten Nächte in den letzten 12 Monaten, nach Alter EU 15 – 1996	Eurostat
6.2.15	Tabelle	Krankenhausaufenthalte nach Hauptdiagnosegruppen (stationäre Patienten) – Anteil an der Gesamtbevölkerung – 1997	Eurostat / OECD
6.2.16	Tabelle	Durchschnittliche Krankenhausverweildauer (in Tagen)	OECD
6.2.17	Tabelle	Durchschnittliche Krankenhausverweildauer für die Hauptdiagnose (in Tagen)	OECD
6.2.18	Tabelle	Krankenhausaufnahmen (stationäre Behandlung) in % der Bevölkerung	OECD
6.2.19	Tabelle	Zufriedenheit mit der gesundheitlichen Versorgung — 1998	Eurobarom
6.2.20	Tabelle	Einstellung zur Häufigkeit der Inanspruchnahme von Gesundheitseinrichtungen – 1996	Eurobarom
6.2.21	Tabelle	Einstellung zur den Einrichtungen, die für Gesundheitsdienste verantwortlich sein sollten – 1998	Eurobarom
6.2.22	Tabelle	Medizinische Einrichtungen der Spitzentechnologie je 1 Million Einwohner – 1997	OECD

6.2.23	Tabelle	Anzahl der Besuche bei einem praktischen Arzt, Facharzt oder Zahnarzt in den letzten 12 Monaten – 1996	Eurostat
6.2.24	Abb.	Einstellung zu der Zeit, die von Ärzten für die Besprechung vorbeugender Maßnahmen und gesunder Lebensweisen aufgewendet wird – 1996	Eurobarom
6.2.25	Tabelle	Medikamente / Person — Anzahl der Verpackungseinheiten	OECD
6.2.26	Tabelle	Arzneimittelkäufe nach Arzneimitteltyp – Apotheken - 1999	IMS Health
6.2.27	Tabelle	Anteil der Bevölkerung, der Medikamente und Vitamine ohne Verschreibung einnimmt — 1996	Eurobarom

3. Behandlungen und medizinische Verfahren

6.3.1	Tabelle	Kaiserschnitte je 1.000 Lebendgeburten	WHO
6.3.2	Tabelle	Organtransplantationen in absoluten Zahlen	Eurostat
6.3.3	Tabelle	Organtransplantationen je 1 Million Einwohner	Eurostat
6.3.4	Tabelle	Dialysepatienten je 1 Million Einwohner	OECD
6.3.5	Tabelle	Herzeingriffe	EHI

4. Kosten und Finanzierung

6.4.1	Tabelle	Anteil der Gesundheitsausgaben insgesamt am BIP	OECD
6.4.2	Tabelle	Anteil Öffentlicher Gesundheitsaufwendungen am BIP	OECD
6.4.3	Abb.	Veränderung (1980-1995) der gesamten und öffentlichen Gesundheitsausgaben in nationalen Währungseinheiten zu relativen Preisen in bezug auf das BIP 1990	OECD
6.4.4	Abb.	Öffentlicher Anteil an den gesamten Gesundheitsausgaben, 1970-1997	OECD
6.4.5	Tabelle	Gesundheitsausgaben insgesamt aufwendungen in KKS pro Kopf	OECD
6.4.6	Tabelle	Gesundheitsausgaben für die stationäre Behandlung insgesamt in KKS pro Kopf	OECD
6.4.7	Tabelle	Gesundheitsausgaben für die ambulante Behandlung insgesamt in KKS pro Kopf	OECD
6.4.8	Tabelle	Konstante Preise – Inländischer Endverbrauch privater Haushalte in Millionen spezifischer KKS. Medizinische Versorgung und Aufwendungen für Gesundheit. Quote je Einwohner	Eurostat
6.4.9	Tabelle	Konstante Preise – Inländischer Endverbrauch privater Haushalte in Millionen spezifischer KKS. Heilmittel und -geräte. Quote je Einwohner	Eurostat
6.4.10	Tabelle	Konstante Preise – Inländischer Endverbrauch privater Haushalte in Millionen spezifischer KKS. Leistungen von Ärzten, Krankenpflegern und verwandten Berufsgruppen. Quote je Einwohner	Eurostat
6.4.11	Tabelle	Gesamtausgaben für Pharmazeutika in KKS pro Kopf	OECD
6.4.12	Tabelle	Konstante Preise – Inländischer Endverbrauch privater Haushalte in Millionen spezifischer KKS. Arzneimittel und Pharmazeutika. Quote je Einwohner	Eurostat
6.4.13	Tabelle	Gesamte Aufwendungen für Sozialleistungen, Krankheit, % des BIP	Eurostat
6.4.14	Tabelle	Aufwendungen für Sozialleistungen: Krankheit / Gesundheitsversorgung, in KKS pro Kopf	Eurostat
6.4.15	Tabelle	Aufwendungen für Sozialleistungen: Krankheit / Gesundheitsversorgung, Sachleistungen, in KKS pro Kopf	Eurostat
6.4.16	Tabelle	Aufwendungen für Sozialleistungen: Krankheit / Gesundheitsversorgung, Geldleistungen, in KKS pro Kopf	Eurostat

6.4.17	Tabelle	Sozialleistungen nach Funktion: Krankheit/Gesundheitsversorgung (alle Versicherungsformen). KKS pro Kopf – 1996	Eurostat
6.4.18	Tabelle	Schutz und Verbesserung der menschlichen Gesundheit in % der gesamten staatlichen FuE-Zuweisungen (endgültiger Haushalt)	Eurostat

7. Anhänge

7.1.1	Beschreibung	Organisation der Gesundheitssysteme	Eurostat
7.1.2	Beschreibung	Übersicht über Systeme zur häuslichen Betreuung	NIVEL
7.1.3	Beschreibung	Beschreibung der Ausgaben privater Haushalte – Hauptformen von Zuzahlungen bei anderen Leistungen des Gesundheitswesens	MISSOC

LIST OF TABLES, GRAPHS AND MAPS

Code	Type	Title	Source
1 POPULATION			
1. Population structure			
1.1.1	table	Total population on 1 January, total.	Eurostat
1.1.2	table	Total population on 1 January, males.	Eurostat
1.1.3	table	Total population on 1 January, females.	Eurostat
1.1.4	table	People aged 0 to 14 as % of total population	Eurostat
1.1.5	graph	People aged 0-14 and 0-19 as % in EUR-15	Eurostat
1.1.6	table	People aged 15 to 24 as % of total population	Eurostat
1.1.7	table	People aged 25 to 49 as % of total population	Eurostat
1.1.8	table	People aged 50 to 64 as % of total population	Eurostat
1.1.9	table	People aged 65 to 79 as % of total population	Eurostat
1.1.10	graph	People aged 65+ and 60+ years in EUR15	Eurostat
1.1.11	table	People aged 80 aged and over as % of total population	Eurostat
1.1.12	table	Age dependency ratio (Population aged 0-14 and 65 and over as a % of population aged 15-64)	Eurostat
2. Births and deaths; life expectancy			
1.2.1	table	Total fertility rate	Eurostat
1.2.2	table	Total live births	Eurostat
1.2.3	table	Crude birth rate	Eurostat
1.2.4	table	Total deaths	Eurostat
1.2.5	table	Crude death rate	Eurostat
1.2.6	table	Net migration	Eurostat
1.2.7	table	Population scenario (baseline), 1997-2050	Eurostat
1.2.8	table	Life expectancy at birth, boys	Eurostat
1.2.9	table	Life expectancy at 65 years: males	Eurostat
1.2.10	table	Life expectancy at birth, girls	Eurostat
1.2.11	table	Life expectancy at 65 years: females	Eurostat
1.2.12	table	Assumptions used for the most recent national life expectancy forecasts	Eurostat
2. LIFE STYLES			
1. Nutrition			
2.1.1	table	% of total energy available from fat in food for human consumption	FAO
2.1.2	table	Average daily fat consumption (in grams per capita) according to type of food - 1997	FAO
2.1.3	table	Average daily number of calories per person (kcal)	FAO
2.1.4	table	Average daily calories per capita according to type of food supply - 1997	FAO
2.1.5	table	% of total energy available from proteins in food for human consumption	FAO
2.1.6	table	Average daily proteins (in grams) per capita according to type of food supply - 1997	FAO
2.1.7	table	% of persons following a diet during the last 12 months - 1996	Eurobarom

2.1.8	graph	% of persons (by age) following a diet during the last 12 months - 1996	Eurobarom
2.1.9	graph	Students (13-15 years) who report being on or feeling that they should be on a diet (%) – 1997/98	HBSC-WHO
2.1.10	table	Daily eating habits in young people: students (15 years) - 1997/98	HBSC-WHO

2. Physical activity

2.2.1	table	Participation in some physical activities, in a typical week, by age (%) – 1997	HFS
2.2.2	graph	Physical inactivity during a working day by level of education, using an inactivity ratio – 1997	HFS
2.2.3	graph	Number of hours spent participating in various leisure physical activities in a typical week (%) – 1997	HFS
2.2.4	table	Perceived barriers to increasing levels of physical activity / exercise – 1997	HFS
2.2.5	graph	Physical activity at work (% of hours sitting down) - 1997	HFS

3. Smoking

2.3.1	table	Percentage of population who are daily cigarette smokers by age and sex - 1995	Eurobarom
2.3.2	table	Smoking prevalence (1970/80/90) by country by age and by sex (in %)	St. Sweden
2.3.3	table	Prevalence of smokers by sex and age group (% of population) – 1994/1998-(Including occasional smokers and adjusted for differences in sex between age groups)	Eurostat
2.3.4	table	Number of cigarettes per day for smokers, by sex (in %) - 1995	Eurobarom
2.3.5	table	Average number of cigarettes per person/year available on the market	WHO

4. Drinking

2.4.1	table	Average litres per person (older than 15)/year of pure alcohol available on the market	WHO
2.4.2	graph	Percentage of boys and girls admitting to drinking alcohol at least once a week, 1997-98, in several Member States	HBSC-WHO

5. Drug use

2.5.1	table	Lifetime prevalence of drug use in recent nation-wide surveys among the general population	EMCDDA
2.5.2	table	Some characteristics of persons treated for drug problems in different EU countries	EMCDDA
2.5.3	graph	Drug use among 15 to 16-year-old school students (ever used)	EMCDDA

6. Sexual behaviour and AIDS risk

2.6.1	table	Sexual life: Number of partners during the last 12 months; condom use; age at first intercourse; frequency of sex	FUSL
2.6.2	table	Fertility rate, live births per 1000 females, in girls under 19 years	Eurostat
2.6.3	table	Total number of legal abortions in girls under 20 years	Eurostat
2.6.4	table	Knowledge on preventive measures to avoid AIDS risk infection (1990-1995)	Eurobarom
2.6.5	table	Knowledge on personal behaviour regarding the risk of AIDS infection (1990-1995)	Eurobarom

7. Other life style factors

2.7.1	table	Number of times that Europeans have exposed themselves to UV-rays with an artificial sun bed or sun lamp - 1997	Eurobarom
-------	-------	---	-----------

3. RISKS ASSOCIATED WITH ENVIRONMENT, WORKING CONDITIONS, LEISURE AND TRAFFIC

1. Environment

3.1.1	table	Emissions of sulphur oxides (SO _x), Kg per capita.	Eurostat
3.1.2	table	Emissions of nitrogen oxides (No _x), Kg per capita	Eurostat
3.1.3	table	Emissions of carbon dioxide (CO ₂), from fossil fuel combustion, Kg per capita	Eurostat
3.1.4	table	Emissions of non-methane Volatile Organic Compounds (NMVOCs), Kg per capita	Eurostat
3.1.5	table	As-TEQ weighted emissions of heavy metals to the air	Öko Inst.
3.1.6	table	Domestic wastewater without treatment (m3 per capita)	TAU
3.1.7	graph	Percentage of population connected to sewage system. 1990.	Eurostat
3.1.8	graph	Noise exposure due to road traffic - early 1980s and 1990s. % of population exposed to Leq, 24 hours > 65 dB (A)	OECD

2. Working conditions

3.2.1	table	Accidents at work in 1996. Standardised incidence rate (9 common branches)	Eurostat
3.2.2	table	Accidents at work in the EU in 1996 by sex	Eurostat
3.2.3	table	Accidents at work in the EU in 1996 by sex and by part of body injured	Eurostat
3.2.4	table	Accidents at work in the EU in 1996 by branch of activity (9 common branches)	Eurostat

3. Home and leisure accidents

3.3.1	graph	Estimated leisure and home accidents by place of accident (% of distribution) - EU-15 - 1995	EHLASS
3.3.2	table	Estimated leisure and home accidents by age and place of accident (% of distribution) - EU-15 - 1995	EHLASS
3.3.3	graph	Estimated leisure and home accidents by activity (% of distribution) EU-15 - 1995	EHLASS
3.3.4	table	Estimated leisure and home accidents by age and by activity (% of distribution) - EU-15 - 1995	EHLASS
3.3.5	graph	Estimated leisure and home accidents by type of injury (% of distribution) EU-15 - 1995	EHLASS
3.3.6	table	Estimated leisure and home accidents by age and by type of injury (% of distribution) - EU-15 - 1995	EHLASS

4. Traffic accidents

3.4.1	table	People injured by road accidents per 100 000 people	WHO
3.4.2	GISCO	Road safety: Number of deaths per million inhabitants in the regions of the EU - 1996	Eurostat

4. HEALTH STATUS

1. Self perceived and measured health

4.1.1	table	Self perception of own health (16+ years) by sex – 1994	Eurostat
4.1.2	table	Self perception of own health (16+ years) according to socio-economic differences – 1994	Eurostat
4.1.3	graph	Perceived health '(very) bad' by level of education (standardised) – 1994	Eurostat
4.1.4	table	Average weight of Europeans by age and sex- 1996	Eurobarom
4.1.5	table	Average height of Europeans by age and sex – 1996	Eurobarom
4.1.6	table	Body Mass Index (BMI) by sex – 1996. (Percentage distribution of population, all ages)	Eurobarom

2. Dental health

4.2.1	table	Satisfaction with own teeth, dentures or false teeth, by sex - 1996	Eurobarom
4.2.2	graph	Satisfaction ('very' and 'fairly') with own teeth, dentures or false teeth, by age and sex – EU 15 - 1996	Eurobarom
4.2.3	graph	Students (11-13) who report (%) brushing their teeth more than once a day – 1997/98	HBSC-WHO
4.2.4	table	DMFT index of decayed, filled or missing teeth at age 12	WHO

3. Disability and restrictions

4.3.1	table	Hampered in daily activities because of chronic conditions by sex (16+ years) - 1994	Eurostat
4.3.2	table	Cutdown of activities because of physical and/or mental reasons (16+ years) - 1994	Eurostat
4.3.3	table	Disability free-life expectancy by sex - 1994	REVES
4.3.4	graph	Estimation of % of persons with a disability - 1992	Eurostat
4.3.5	graph	Estimation of population of disabled persons receiving financial aid linked to a disability - 1991	Eurostat
4.3.6	graph	Breakdown of disabled persons by degree of disability - 1992	Eurostat
4.3.7	graph	Total visually impaired population – 1994. Per 100 000 of total population	EBU
4.3.8	table	Percentage of persons declaring a permanent disability for work over total population, by sex – 1997	Eurostat

4. Diagnostic related morbidity

4.4.1	table	Incidence of types of cancer in 1990/1995. Age-standardised rate per 100 000 males (standard world population)	IARC
4.4.2	table	Incidence of types of cancer in 1990/1995. Age-standardised rate per 100 000 females (standard world population)	IARC
4.4.3	graph	Percentage of specific cancers over total of cancers, males, females –1995	IARC
4.4.4	table	Estimation of absolute number of incident cancer cases in 1995 and 1 and 5 year prevalence	IARC
4.4.5	table	Five-year age-standardised relative survival (%) of European adult cancer patients (15+ years of age) by sex and country - 1985/1989	EUROCARE
4.4.6	table	AIDS incidence rates per million population by year of diagnosis, with adjustments for reporting delays	ECEMA
4.4.7	table	New AIDS cases per year of diagnosis	ECEMA
4.4.8	table	Cases of AIDS per age group (% over cumulative total)	ECEMA
4.4.9	graph	Cumulative AIDS cases by transmission group. People aged 13 or over, reported by 31 December 1998	ECEMA
4.4.10	graph	Cumulative paediatric AIDS cases. Infants under 1 year, reported by 31 December 1998 (% over total cases).	ECEMA
4.4.11	graph	Percentage, over cumulative total AIDS cases at 31.12.98, of persons infected with HIV-2	ECEMA
4.4.12	table	HIV reporting data in 1998	ECEMA
4.4.13	table	Systematic HIV antibody screening in blood banks: HIV prevalence in blood donations by country	ECEMA
4.4.14	table	Incidence of tuberculosis, total per 100 000 persons	EuroTB
4.4.15	graph	Tuberculosis notification rate (%) by sex, diagnosed in 1996	EuroTB
4.4.16	graph	Monitored linked clinical-virological surveillance for influenza in Europe 1997/98 and 1999/2000	Flu-Net
4.4.17	table	Incidence of hepatitis B, total per 100 000 persons.	WHO
4.4.18	table	Incidence of malaria, total per 100 000 persons	WHO

4.4.19	table	Incidence of diseases preventable by recommended immunisation, total per 100 000 persons, 1995-1997	WHO
4.4.20	table	Incidence of syphilis, total per 100 000 persons	WHO
4.4.21	table	Incidence of gonococcal infections, total per 100 000 persons	WHO
4.4.22	graph	Distribution of reported STD cases: Italy 1991-1996.	EuroSurveillance
4.4.23	graph	Hepatitis C virus (HCV) prevalence (in % of population) by country, 1997	WHO
4.4.24	table	Creutzfeld-Jacob Disease: confirmed and suspected cases per year of diagnosis	
4.4.25	table	Prevalence rate (per 10 000 births) of some congenital anomalies in the 25 Eurocat registries (total): 1980-1994	EUROCAT
4.4.26	table	Prevalence rate (per 10 000 births) of some congenital anomalies by Eurocat registry, 1980-1994	EUROCAT
4.4.27	graph	Relative frequency (in %) by groups of congenital anomalies, 1980-1994	EUROCAT
4.4.28	table	Recognised occupational diseases in EU. Incidence per million, by NACE branches - 1995	Eurostat
4.4.29	graph	Recognised occupational diseases in EU-15. Percentage of total cases - 1995	Eurostat
4.4.30	table	Incidence per 10 000 by age and sex of hip fractures associated with osteoporosis	
4.4.31	table	Prevalence per 10 000 by age and sex of vertebrae fractures associated with osteoporosis	
4.4.32	graph	Age-standardised myocardial infarction incidence rates per 100 000 (35-64 age) and case-fatality rates at 28 days	MONICA
4.4.33	graph	Prevalence estimate of diabetes. % over total population - 1994	IDI/WHO
4.4.34	table	Estimation of absolute number of people with diabetes (1994) and projections for 2000 and 2010	IDI/WHO
4.4.35	graph	Estimated cases (per 1 000) of all dementia and Alzheimer disease over population aged more than 65 years	AlzheimerEurope
4.4.36	graph	Estimated prevalence, by age, for some neurodegenerative diseases of old age	EURODEM

5. MORTALITY

1. Infant mortality

5.1.1	table	Infant mortality rate	Eurostat
5.1.2	GISCO	Infant mortality rate by region, 1995	Eurostat
5.1.3	table	Infant deaths (under one year)	Eurostat
5.1.4	graph	Main causes of deaths of children under one year, boys, EU 15, 1996.	Eurostat
5.1.5	graph	Main causes of deaths of children under one year, girls, EU 15, 1996.	Eurostat
5.1.6	graph	Death rate per 10 000 live births due to the sudden infant death syndrome – 1996	Eurostat
5.1.7	table	Perinatal mortality rate	Eurostat
5.1.8	table	Neonatal mortality rate	Eurostat
5.1.9	table	Early neonatal mortality rate	Eurostat
5.1.10	table	Late foetal mortality rate	Eurostat
5.1.11	table	Deaths of children under 28 days	Eurostat
5.1.12	table	Deaths of children under 7 days	Eurostat

2. Mortality by cause

5.2.1	table	Standard death rate by 65 causes, men, 1996	Eurostat
5.2.2	table	Standard death rate by 65 causes, women, 1996	Eurostat

5.2.3	graph	Main causes of death by groups (% of total causes) , men and women, EU 15 – 1996	Eurostat
5.2.4	graph	Causes of death by age groups in 1996 (EU 15) (in %), men	Eurostat
5.2.5	graph	Causes of death by age groups in 1996 (EU 15) (in %), women	Eurostat
5.2.6	table	Proportion (%) of causes of death over total number of deaths in EU 15 – 1996, by age and sex	Eurostat
5.2.7	table	Maternal deaths (SDR), all causes/100 000 live births	WHO
5.2.8	table	Death (SDR) from infectious and parasitic diseases, all ages: men per 100 000 men	WHO
5.2.9	table	Death (SDR) from infectious and parasitic diseases, all ages: women per 100 000 women	WHO
5.2.10	GISCO	Crude death rate from infectious and parasitic diseases, all ages: 1995 – per 100 000 inhabitants	Eurostat
5.2.11	table	Death (SDR) from cancer, all ages: men per 100 000 men	WHO
5.2.12	table	Death (SDR) from cancer, all ages: women per 100 000 women	WHO
5.2.13	GISCO	Crude death rate from cancer, all ages: 1995 – per 100 000 inhabitants	Eurostat
5.2.14	table	Death (SDR) from cervix uteri cancer, all ages: women per 100 000 women	WHO
5.2.15	table	Death (SDR) from breast cancer, all ages: women per 100 000 women	WHO
5.2.16	GISCO	Crude death rate from breast cancer, all ages: 1995 – per 100 000 inhabitants	Eurostat
5.2.17	table	Death (SDR) from trachea, bronchus, lung cancer, all ages: men per 100 000 men	WHO
5.2.18	table	Death (SDR) from trachea, bronchus, lung cancer, all ages: women per 100 000 women	WHO
5.2.19	GISCO	Crude death rate from trachea, bronchus, lung cancer, all ages: 1995 – per 100 000 inhabitants	Eurostat
5.2.20	table	Death (SDR) from diabetes mellitus, all ages: men per 100 000 men	WHO
5.2.21	table	Death (SDR) from diabetes mellitus, all ages: women per 100 000 women	WHO
5.2.22	GISCO	Crude death rate from diabetes mellitus, all ages: 1995 – per 100 000 inhabitants	Eurostat
5.2.23	table	Death (SDR) from ischaemic heart diseases, all ages: men per 100 000 men	WHO
5.2.24	table	Death (SDR) from ischaemic heart diseases, all ages: women per 100 000 women	WHO
5.2.25	GISCO	Crude death rate from ischaemic heart disease, all ages: 1995 – per 100 000 inhabitants	Eurostat
5.2.26	table	Death (SDR) from cerebrovascular disease, all ages: men per 100 000 men	WHO
5.2.27	table	Death (SDR) from cerebrovascular disease, all ages: women per 100 000 women	WHO
5.2.28	GISCO	Crude death rate from cerebrovascular disease, all ages: 1995 – per 100 000 inhabitants	Eurostat
5.2.29	table	Death (SDR) from diseases of the respiratory system, all ages: men per 100 000 men	WHO
5.2.30	table	Death (SDR) from diseases of the respiratory system, all ages: women per 100 000 women	WHO
5.2.31	GISCO	Crude death rate from diseases of the respiratory system, all ages: 1995 – per 100 000 inhabitants	Eurostat
5.2.32	table	Death (SDR) by suicide, all ages: men per 100 000 men	WHO
5.2.33	table	Death (SDR) by suicide, all ages: women per 100 000 women	WHO

5.2.34	GISCO	Crude death rate by suicide, all ages: 1995 – per 100 000 inhabitants	Eurostat
5.2.35	table	Death (SDR) in motor-vehicle traffic accidents, all ages: men per 100 000 men	Eurostat
5.2.36	table	Death (SDR) in motor-vehicle traffic accidents, all ages: women per 100 000 women	Eurostat
3. Special mortality causes			
5.3.1	table	Absolute number of deaths primarily due to alcohol abuse (including alcoholic psychosis) by age and sex- 1996	Eurostat
5.3.2	table	Number of acute drug-related deaths recorded in EU countries	EMCDDA
6. HEALTH CARE			
1. Human resources			
6.1.1	table	Persons employed in health and social work, males and females	Eurostat
6.1.2	table	Percentage of employment in health and social work sector over total employment	Eurostat
6.1.3	table	Total number of physicians	Eurostat
6.1.4	table	Physicians per 100 000 inhabitants	Eurostat
6.1.5	GISCO	Physicians per 1 000 inhabitants - 1995	Eurostat
6.1.6	table	Physicians by sex (% of total) - 1996	Eurostat
6.1.7	table	Percentage of physicians by age groups according to sex for nine EEA countries – 1996 (% over total by sex)	Eurostat
6.1.8	table	Medical specialists (Absolute number per some specialities)	Eurostat
6.1.9	table	Medical specialists (Per million of population per some specialities)	Eurostat
6.1.10	table	Total number of dentists	Eurostat
6.1.11	table	Dentists per 100 000 inhabitants	Eurostat
6.1.12	table	Total number of pharmacists	Eurostat
6.1.13	table	Pharmacists per 100 000 inhabitants	Eurostat
6.1.14	table	Total number of nurses and midwives	Eurostat
6.1.15	table	Nurses and midwives per 100 000 inhabitants	Eurostat
6.1.16	table	Total number of physiotherapists	Eurostat
6.1.17	table	Physiotherapists per 100 000 inhabitants	Eurostat
2. Facilities and consumption			
6.2.1	graph	Proportion (%) of immunised children aged less than 2 years in EU countries – 1997	CIE/ WHO
6.2.2	table	Percentage of population reporting general preventive examinations, EU-15, 1996	Eurobarom
6.2.3	graph	Percentage of population reporting general preventive examinations, by age, EU-15, 1996	Eurobarom
6.2.4	table	Percentage of women reporting specific preventive examinations, EU-15, 1996	Eurobarom
6.2.5	graph	Percentage of women reporting specific preventive examinations by age, EU-15, 1996	Eurobarom
6.2.6	table	Total number of hospital beds (including psychiatric beds)	Eurostat
6.2.7	table	Hospital beds (including psychiatric beds) per 100 000 inhabitants	Eurostat
6.2.8	GISCO	Hospital beds (including psychiatric beds) per 1 000 inhabitants – 1995	Eurostat
6.2.9	table	Total number of psychiatric hospital beds	Eurostat

6.2.10	table	Psychiatric hospital beds per 100 000 inhabitants	Eurostat
6.2.11	table	Hospitalisation during the last 12 months (16+ years) – 1994	Eurostat
6.2.12	graph	Hospitalisation (% of population) during the last 12 months by age – 1994 - EU 12	Eurostat
6.2.13	table	Number of nights spent in a hospital during the past 12 months, by sex – EU 15 – 1996	Eurostat
6.2.14	table	Number of nights spent in a hospital during the past 12 months, by age - EU 15 - 1996	Eurostat
6.2.15	table	Discharges from hospitals by main group of diagnosis (patients admitted for night and day) – Rate over total population - 1997	Eurostat / OECD
6.2.16	table	Average length of stay in hospital (in days)	OECD
6.2.17	table	Average length of stay in hospital for main diagnosis (in days)	OECD
6.2.18	table	Admissions (in-patient care) as % of population	OECD
6.2.19	table	Satisfaction with health services - 1998	Eurobarom
6.2.20	table	Attitudes regarding frequency of use of health care facilities - 1996	Eurobarom
6.2.21	table	Institutions which should be responsible for health services - 1998	Eurobarom
6.2.22	table	High-tech medical facilities per million of population - 1997	OECD
6.2.23	table	Number of consultations of a general practitioner, medical specialist or dentist during the last 12 months - 1996	Eurostat
6.2.24	graph	Opinion on time spent by doctors discussing preventive action and healthy lifestyle - 1996	Eurobarom
6.2.25	table	Medicines /person - Number of containers	OECD
6.2.26	table	Drugs purchases by type of drug – Retail pharmacies - 1999	IMS Health
6.2.27	table	% of population consuming medicines or vitamins without prescription - 1996	Eurobarom

3. Treatments and medical procedures

6.3.1	table	Caesarean sections per 1 000 live births	WHO
6.3.2	table	Organ transplantation, absolute figures	Eurostat
6.3.3	table	Organ transplantation, per million of population	Eurostat
6.3.4	table	Patients undergoing dialysis per million of population	OECD
6.3.5	table	Cardiac interventions	EHI

4. Cost and financing

6.4.1	table	Total health expenditure as a proportion of GDP	OECD
6.4.2	table	Public health expenditure as a proportion of GDP	OECD
6.4.3	graph	Change (1980-1995) in total and public health expenditure on national currency units at 1990 GDP relative prices	OECD
6.4.4	graph	Public share in total spending on health, 1970-1997	OECD
6.4.5	table	Total health expenditure in PPP per capita	OECD
6.4.6	table	Total expenditure on in-patient care in PPP per capita	OECD
6.4.7	table	Total expenditure on ambulatory care in PPP per capita	OECD
6.4.8	table	Constant prices - Final consumption of households on the economic territory in millions of specific PPS. Medical care and health expenses. Ratio per inhabitant	Eurostat
6.4.9	table	Constant prices - Final consumption of households on the economic territory in millions of specific PPS. Therapeutical appliances and equipment. Ratio per inhabitant	Eurostat
6.4.10	table	Constant prices - Final consumption of households on the economic territory in millions of specific PPS. Services of physicians, nurses and related practitioners. Ratio per inhabitant	Eurostat
6.4.11	table	Total expenditure on pharmaceutical goods in PPS per capita	OECD

6.4.12	table	Constant prices - Final consumption of households on the economic territory in millions of specific PPS. Medical and pharmaceutical products. Ratio per inhabitant	Eurostat
6.4.13	table	Expenditure on social protection benefits, sickness, % of GDP	Eurostat
6.4.14	table	Expenditure on social protection benefits: sickness/health care, in PPS per capita	Eurostat
6.4.15	table	Expenditure on social protection benefits: sickness/health care, benefits in kind, in PPS per capita	Eurostat
6.4.16	table	Expenditure on social protection benefits: sickness/health care, benefits in cash, in PPS per capita	Eurostat
6.4.17	table	Social benefits detailed by function: sickness/ health care (all schemes). PPS per capita - 1996	Eurostat
6.4.18	table	Protection and improvement of human health as % of total R&D government appropriations (final budget)	Eurostat

7. Annexes

7.1.1	description	Organisation of the health systems	Eurostat
7.1.2	description	Description of home-care systems	NIVEL
7.1.3	description	Description of out of pocket payments - main cost sharing measure for other health-care services	MISSOC

LISTE DES TABLEAUX, GRAPHIQUES ET CARTES

Code	Type	Titre	Source
1 POPULATION			
1. Structure de la population			
1.1.1	tableau	Population totale au 1 ^{er} janvier, total	Eurostat
1.1.2	tableau	Population totale au 1 ^{er} janvier, hommes	Eurostat
1.1.3	tableau	Population totale au 1 ^{er} janvier, femmes	Eurostat
1.1.4	tableau	Personnes âgées de 0 à 14 ans en % de la population totale	Eurostat
1.1.5	graphique	Personnes âgées de 0 à 14 ans et de 0 à 19 ans en % dans EU-15	Eurostat
1.1.6	tableau	Personnes âgées de 15 à 24 ans en % de la population totale	Eurostat
1.1.7	tableau	Personnes âgées de 25 à 49 ans en % de la population totale	Eurostat
1.1.8	tableau	Personnes âgées de 50 à 64 ans en % de la population totale	Eurostat
1.1.9	tableau	Personnes âgées de 65 à 79 ans en % de la population totale	Eurostat
1.1.10	graphique	Personnes âgées de 65 ans et plus et de 60 ans et plus dans EU-15	Eurostat
1.1.11	tableau	Personnes âgées de 80 ans et plus en % de la population totale	Eurostat
1.1.12	tableau	Taux de dépendance (population âgée de 0 à 14 ans et de 65 ans et plus en % de la population âgée de 15 à 64 ans)	Eurostat
2. Naissances et décès; espérance de vie			
1.2.1	tableau	Taux global de fécondité	Eurostat
1.2.2	tableau	Total des naissances vivantes	Eurostat
1.2.3	tableau	Taux brut de natalité	Eurostat
1.2.4	tableau	Total des décès	Eurostat
1.2.5	tableau	Taux brut de mortalité	Eurostat
1.2.6	tableau	Migration nette	Eurostat
1.2.7	tableau	Scénario démographique (de base), 1997-2050	Eurostat
1.2.8	tableau	Espérance de vie à la naissance, hommes	Eurostat
1.2.9	tableau	Espérance de vie à 65 ans: hommes	Eurostat
1.2.10	tableau	Espérance de vie à la naissance, femmes	Eurostat
1.2.11	tableau	Espérance de vie à 65 ans: femmes	Eurostat
1.2.12	tableau	Hypothèses utilisées pour les prévisions nationales les plus récentes en matière d'espérance de vie	Eurostat
2. MODES DE VIE			
1. Alimentation			
2.1.1	tableau	Pourcentage de l'énergie totale disponible dans les matières grasses des aliments destinés à la consommation humaine	FAO
2.1.2	tableau	Consommation quotidienne moyenne de matière grasse (en grammes par personne) selon le type d'aliments - 1997	FAO
2.1.3	tableau	Apports journaliers moyens de calories par personne (kcal)	FAO
2.1.4	tableau	Apports journaliers moyens de calories par personne en fonction du type d'alimentation - 1997	FAO
2.1.5	tableau	Pourcentage de l'énergie totale disponible dans les protéines des aliments destinés à la consommation humaine	FAO

2.1.6	tableau	Apports journaliers moyens de protéines (en grammes) par personne en fonction du type d'alimentation - 1997	FAO
2.1.7	tableau	Pourcentage de personnes ayant suivi un régime au cours des 12 derniers mois – 1996	Eurobarom
2.1.8	graphique	Pourcentage de personnes (par groupe d'âge) ayant suivi un régime au cours des 12 derniers mois – 1996	Eurobarom
2.1.9	graphique	Jeunes scolarisés (13-15 ans) qui déclarent être au régime ou en éprouver le besoin (%) – 1997/1998	HBSC-OMS
2.1.10	tableau	Habitudes alimentaires quotidiennes des jeunes: étudiants (15 ans) - 1997/1998	HBSC-OMS

2. Activité physique

2.2.1	tableau	Participation habituelle à des activités physiques, au cours d'une semaine, par groupe d'âge (%) – 1997	HFS
2.2.2	graphique	Sédentarité pendant un jour ouvrable par niveau d'éducation, mesurée à l'aide d'un ratio de sédentarité – 1997	HFS
2.2.3	graphique	Nombre d'heures consacrées habituellement à diverses activités physiques au cours d'une semaine (%) – 1997	HFS
2.2.4	tableau	Obstacles perçus à l'augmentation du niveau d'activité/exercice physique – 1997	HFS
2.2.5	graphique	Activité physique au travail (% d'heures en position assise) - 1997	HFS

3. Tabagisme

2.3.1	tableau	Pourcentage de la population qui fume quotidiennement, par âge et par sexe - 1995	Eurobarom
2.3.2	tableau	Prévalence du tabagisme (1970/80/90) par pays et par sexe (en %)	INS Suède
2.3.3	tableau	Prévalence des fumeurs par sexe et par groupe d'âge (% de la population) – 1994/1998 - (comprenant les fumeurs occasionnels et corrigée des différences par sexe entre les groupes d'âge)	Eurostat
2.3.4	tableau	Nombre de cigarettes par jour par fumeur, par sexe (en %) - 1995	Eurobarom
2.3.5	tableau	Nombre moyen de cigarettes par personne/an disponibles sur le marché	OMS

4. Consommation d'alcool

2.4.1	tableau	Nombre moyen de litres par personne (âgées de plus de 15 ans)/an d'alcool pur disponible sur le marché	OMS
2.4.2	graphique	Pourcentage de jeunes gens reconnaissant boire de l'alcool au moins une fois par semaine, 1997-1998, dans plusieurs États membres	HBSC-OMS

5. Toxicomanie

2.5.1	tableau	Prévalence sur la vie de la toxicomanie parmi la population générale, d'après des enquêtes nationales récentes	OEDT
2.5.2	tableau	Quelques caractéristiques des patients traités pour des problèmes de toxicomanie dans différents pays de l'UE	OEDT
2.5.3	graphique	Toxicomanie chez les jeunes de 15 à 16 ans scolarisés (au moins une occurrence)	OEDT

6. Comportement sexuel et risque de SIDA

2.6.1	tableau	Vie sexuelle: nombre de partenaires au cours des 12 derniers mois; utilisation du préservatif; âge lors du premier rapport; fréquence des rapports	FUSL
2.6.2	tableau	Taux de fécondité, naissances vivantes pour 1 000 femmes, chez les jeunes filles de moins de 19 ans	Eurostat

2.6.3	tableau	Nombre total d'avortements légaux chez les jeunes filles de moins de 20 ans	Eurostat
2.6.4	tableau	Attitudes en matière de mesures préventives personnelles contre les risques de SIDA (1990-1995)	Eurobarom
2.6.5	tableau	Connaissance des risques de SIDA du fait du comportement personnel (1990-1995)	Eurobarom

7. Autres facteurs liés au mode de vie

2.7.1	tableau	Nombre de cas d'exposition des Européens à des rayons U.V. - 1997	Eurobarom
-------	---------	---	-----------

3. RISQUES LIÉS À L'ENVIRONNEMENT, AUX CONDITIONS DE TRAVAIL, AUX LOISIRS ET À LA CIRCULATION

1. Environnement

3.1.1	tableau	Émissions d'oxydes de soufre (SO _x), en kg par personne.	Eurostat
3.1.2	tableau	Émissions d'oxydes d'azote (NO _x), en kg par personne	Eurostat
3.1.3	tableau	Émissions de dioxyde de carbone (CO ₂), provenant de la combustion des énergies fossiles, en kg par personne	Eurostat
3.1.4	tableau	Émissions de composés organiques volatils non méthaniques (COVNM), en kg par personne	Eurostat
3.1.5	tableau	Émissions pondérées de métaux lourds dans l'air en équivalents toxiques (AsTEQ)	Öko Inst.
3.1.6	tableau	Eaux usées domestiques non traitées (en m ³ par personne)	TAU
3.1.7	graphique	Pourcentage de la population relié à un système d'égout, 1990	Eurostat
3.1.8	graphique	Exposition au bruit dû au trafic routier - début des années 1980 et années 1990. Pourcentage de la population exposée à plus de 65 dB (A) Leq 24h	OCDE

2. Conditions de travail

3.2.1	tableau	Accidents du travail en 1996. Taux d'incidence standardisé (9 secteurs communs)	Eurostat
3.2.2	tableau	Accidents du travail dans l'UE en 1996, par sexe	Eurostat
3.2.3	tableau	Accidents du travail dans l'UE en 1996, par sexe et par partie du corps blessée	Eurostat
3.2.4	tableau	Accidents du travail dans l'UE en 1994, par secteur d'activité (9 secteurs communs)	Eurostat

3. Accidents domestiques et de loisirs

3.3.1	graphique	Estimation du nombre d'accidents domestiques et de loisirs, par lieu de l'accident (% de distribution) - EU-15 - 1995	EHLASS
3.3.2	tableau	Estimation du nombre d'accidents domestiques et de loisirs, par âge et lieu de l'accident (% de distribution) - EU-15 - 1995	EHLASS
3.3.3	graphique	Estimation du nombre d'accidents domestiques et de loisirs, par activité (% de distribution) EU-15 - 1995	EHLASS
3.3.4	tableau	Estimation du nombre d'accidents domestiques et de loisirs, par âge et par activité (% de distribution) - EU-15 - 1995	EHLASS
3.3.5	graphique	Estimation du nombre d'accidents domestiques et de loisirs, par type de blessure (% de distribution) EU-15 - 1995	EHLASS
3.3.6	tableau	Estimation du nombre d'accidents domestiques et de loisirs, par âge et par type de blessure (% de distribution) - EU-15 - 1995	EHLASS

4. Accidents de la circulation

3.4.1	tableau	Nombre de personnes blessées dans un accident de la circulation, pour 100 000 personnes	WHO
3.4.2	GISCO	Nombre de décès par million d'habitants dans les régions de l'UE - 1996	Eurostat

4. ÉTAT DE SANTÉ

1. État de santé ressenti et mesuré

4.1.1	tableau	État de santé ressenti (16 ans et plus), par sexe – 1994	Eurostat
4.1.2	tableau	État de santé ressenti (16 ans et plus) en fonction des disparités socio-économiques en matière de santé – 1994	Eurostat
4.1.3	graphique	État de santé ressenti comme “(très) mauvais” par niveau d’éducation (standardisé) – 1994	Eurostat
4.1.4	tableau	Poids moyen des Européens, par âge et par sexe - 1996	Eurobarom
4.1.5	tableau	Taille moyenne des Européens, par âge et par sexe – 1996	Eurobarom
4.1.6	tableau	Indice de masse corporelle (IMC) par sexe – 1996 (répartition en pourcentage de la population, tous âges)	Eurobarom

2. Santé dentaire

4.2.1	tableau	Satisfaction concernant les dents, les dentiers et les fausses dents, par sexe – 1996	Eurobarom
4.2.2	graphique	Satisfaction (“très satisfait” et “assez satisfait”) concernant les dents, les dentiers et les fausses dents, par âge et par sexe – EU-15 - 1996	Eurobarom
4.2.3	graphique	Jeunes scolarisés (âgés de 11 à 13 ans) qui déclarent (%) se brosser les dents plus d’une fois par jour – 1997/1998	HBSC-OMS
4.2.4	tableau	Indice de dents cariées, absentes ou obturées à l’âge de 12 ans	OMS

3. Incapacités et restrictions

4.3.1	tableau	Gêne dans les activités quotidiennes en raison d’affections chroniques, par sexe (16 ans et plus) - 1994	Eurostat
4.3.2	tableau	Limitation des activités en raison de problèmes physiques et/ou mentaux (16 ans et plus) - 1994	Eurostat
4.3.3	tableau	Espérance de vie sans incapacité, par sexe - 1994	REVES
4.3.4	graphique	Estimation de la population de personnes handicapées - 1992	Eurostat
4.3.5	graphique	Estimation de la population de personnes handicapées bénéficiaires d’une aide financière liée au handicap - 1991	Eurostat
4.3.6	graphique	Répartition des handicapés par degré d’incapacité - 1992	Eurostat
4.3.7	graphique	Population totale de malvoyants – 1994, pour 100 000 personnes de la population totale	UEA
4.3.8	tableau	Personnes déclarant une incapacité de travail permanente, en pourcentage de la population totale, par sexe – 1997	Eurostat

4. Morbidité en fonction du diagnostic

4.4.1	tableau	Incidence des différents types de cancer en 1990/1995. Taux standardisé par âge pour 100 000 hommes (population type mondiale)	CIRC
4.4.2	tableau	Incidence des différents types de cancer en 1990/1995. Taux standardisé par âge pour 100 000 femmes (population type mondiale)	CIRC
4.4.3	graphique	Nombre de cancers spécifiques, en pourcentage du nombre total de cancers, hommes, femmes – 1995	CIRC
4.4.4	tableau	Estimation du nombre absolu d’incidences des cancers en 1995, et prévalence à 1 an et à 5 ans	CIRC
4.4.5	tableau	Survie relative de 5 ans (%), standardisée par âge, des patients européens adultes (15 ans et plus) atteints d’un cancer, par sexe et par pays - 1985/1989	EUROCARE
4.4.6	tableau	Taux d’incidence du SIDA par million d’habitants et par année de diagnostic, avec correction du délai de déclaration	ECEMA
4.4.7	tableau	Nouveaux cas de SIDA par année de diagnostic	ECEMA

4.4.8	tableau	Cas de SIDA par groupe d'âge (% du total cumulé)	ECEMA
4.4.9	graphique	Cas cumulés de SIDA par groupe de transmission, personnes âgées de 13 ans ou plus, déclarés au 31 décembre 1998	ECEMA
4.4.10	graphique	Cas cumulés de SIDA pédiatrique, enfants de moins d'un an, déclarés au 31 décembre 1998 (% du nombre total de cas)	ECEMA
4.4.11	graphique	Pourcentage de personnes atteintes du VIH-2, par rapport au total des cas cumulés de SIDA au 31.12.1998	ECEMA
4.4.12	tableau	Données sur les déclarations de cas de VIH en 1998	ECEMA
4.4.13	tableau	Dépistage systématique des anticorps anti-VIH dans les centres de transfusion: prévalence du VIH dans les dons de sang, par pays	ECEMA
4.4.14	tableau	Incidence de la tuberculose, total pour 100 000 habitants	EuroTB
4.4.15	graphique	Taux de notification de la tuberculose (%) par sexe, diagnostiquée en 1996	EuroTB
4.4.16	graphique	Surveillances clinique et virale associées de la grippe en Europe 1997/1998 et 1999/2000	Flu-Net
4.4.17	tableau	Incidence de l'hépatite B, total pour 100 000 personnes	OMS
4.4.18	tableau	Incidence de la malaria, total pour 100 000 personnes	OMS
4.4.19	tableau	Incidence des maladies contre lesquelles la vaccination est recommandée, total pour 100 000 personnes, 1995-1997	OMS
4.4.20	tableau	Incidence de la syphilis, total pour 100 000 personnes	OMS
4.4.21	tableau	Incidence des infections gonocoques, total pour 100 000 personnes	OMS
4.4.22	graphique	Répartition des cas de MST déclarés: Italie 1991-1996	EuroSurveillance
4.4.23	graphique	Prévalence du virus de l'hépatite C (VHC) (en % de la population) par pays, 1997	OMS
4.4.24	tableau	Maladie de Creutzfeldt-Jakob: cas confirmés et suspectés, par année de diagnostic	
4.4.25	tableau	Taux de prévalence (pour 10 000 naissances) de certaines anomalies congénitales dans les 25 répertoires Eurocat (total): 1980-1994	EUROCAT
4.4.26	tableau	Taux de prévalence (pour 10 000 naissances) de certaines anomalies congénitales par répertoire Eurocat, 1980-1994	EUROCAT
4.4.27	graphique	Fréquence relative (en %) par groupes d'anomalies congénitales, 1980-1994	EUROCAT
4.4.28	tableau	Maladies professionnelles reconnues dans l'UE. Incidence par million d'habitants, par branche d'activité de la NACE - 1995	Eurostat
4.4.29	graphique	Maladies professionnelles reconnues dans EU-15. Pourcentage du nombre total de cas - 1995	Eurostat
4.4.30	tableau	Incidence pour 10 000 personnes, par âge et par sexe, des fractures du col du fémur liées à l'ostéoporose	DG SANCO
4.4.31	tableau	Prévalence pour 10 000 personnes, par âge et par sexe, des fractures vertébrales liées à l'ostéoporose	DG SANCO
4.4.32	graphique	Taux d'incidence standardisé par âge de l'infarctus du myocarde pour 100 000 personnes (âgées de 35 à 64 ans) et taux de mortalité à 28 jours	MONICA
4.4.33	graphique	Prévalence estimée du diabète. Taux brut par million de personnes - 1994	IDI/OMS
4.4.34	tableau	Estimation du nombre absolu de personnes atteintes du diabète (1994) et projections pour 2000 et 2010	IDI/OMS
4.4.35	graphique	Estimation du nombre total de cas (pour 1 000 personnes) de démence et de la maladie d'Alzheimer chez la population âgée de plus de 65 ans	Alzheimer Europe
4.4.37	graphique	Prévalence estimée, par âge, de certaines maladies neurodégénératives séniles	EURODEM

5. MORTALITÉ

1. Mortalité infantile

5.1.1	tableau	Taux de mortalité infantile	Eurostat
5.1.2	GISCO	Taux de mortalité infantile par région, 1995	Eurostat
5.1.3	tableau	Décès d'enfants (de moins d'un an)	Eurostat
5.1.4	graphique	Principales cause de décès d'enfants de moins d'un an, garçons, EU-15, 1996	Eurostat
5.1.5	graphique	Principales cause de décès d'enfants de moins d'un an, filles, EU-15, 1996	Eurostat
5.1.6	graphique	Taux de mortalité pour 10 000 naissances vivantes en 1995, due au syndrome de mort subite du nourrisson	Eurostat
5.1.7	tableau	Taux de mortalité périnatale	Eurostat
5.1.8	tableau	Taux de mortalité néonatale	Eurostat
5.1.9	tableau	Taux de mortalité néonatale précoce	Eurostat
5.1.10	tableau	Taux de mortalité intra-utérine tardive	Eurostat
5.1.11	tableau	Décès de nourrissons de moins de 28 jours	Eurostat
5.1.12	tableau	Décès de nourrissons de moins de 7 jours	Eurostat

2. Mortalité par cause

5.2.1	tableau	Taux de mortalité standardisé pour 65 causes, hommes, 1996	Eurostat
5.2.2	tableau	Taux de mortalité standardisé pour 65 causes, femmes, 1996	Eurostat
5.2.3	graphique	Principales causes de décès (%), hommes et femmes, dans EU-15 – 1996	Eurostat
5.2.4	graphique	Causes de décès par groupes d'âge en 1996 (EU-15) (en %), hommes	Eurostat
5.2.5	graphique	Causes de décès par groupes d'âge en 1996 (EU-15) (en %), femmes	Eurostat
5.2.6	tableau	Proportion (%) des causes de décès par rapport au nombre total de décès dans EU-15 – 1996, par âge et par sexe	Eurostat
5.2.7	tableau	Décès maternels (TMS), toutes causes/100 000 naissances vivantes	OMS
5.2.8	tableau	Décès (TMS) par maladies infectieuses et parasitaires, tous âges: hommes pour 100 000 hommes	OMS
5.2.9	tableau	Décès (TMS) par maladies infectieuses et parasitaires, tous âges: femmes pour 100 000 femmes	OMS
5.2.10	GISCO	Taux brut de mortalité par maladies infectieuses et parasitaires, tous âges: 1995 – pour 100 000 habitants	Eurostat
5.2.11	tableau	Décès (TMS) par cancer, tous âges: hommes pour 100 000 hommes	OMS
5.2.12	tableau	Décès (TMS) par cancer, tous âges: femmes pour 100 000 femmes	OMS
5.2.13	GISCO	Taux brut de mortalité par cancer, tous âges: 1995 – pour 100 000 habitants	Eurostat
5.2.14	tableau	Décès (TMS) par cancer du col de l'utérus, tous âges: femmes pour 100 000 femmes	OMS
5.2.15	tableau	Décès (TMS) par cancer du sein, tous âges: femmes pour 100 000 femmes	OMS
5.2.16	GISCO	Taux brut de mortalité par cancer du sein, tous âges: 1995 – pour 100 000 habitants	Eurostat
5.2.17	tableau	Décès (TMS) par cancer de la trachée, des bronches, du poumon, tous âges: hommes pour 100 000 hommes	OMS
5.2.18	tableau	Décès (TMS) par cancer de la trachée, des bronches, du poumon, tous âges: femmes pour 100 000 femmes	OMS

5.2.19	GISCO	Taux brut de mortalité par cancer de la trachée, des bronches, du poumon, tous âges: 1995 – pour 100 000 habitants	Eurostat
5.2.20	tableau	Décès (TMS) par diabète sucré, tous âges: hommes pour 100 000 hommes	OMS
5.2.21	tableau	Décès (TMS) par diabète sucré, tous âges: femmes pour 100 000 femmes	OMS
5.2.22	GISCO	Taux brut de mortalité par diabète sucré, tous âges: 1995 – pour 100 000 habitants	Eurostat
5.2.23	tableau	Décès (TMS) par cardiopathie ischémique, tous âges: hommes pour 100 000 hommes	OMS
5.2.24	tableau	Décès (TMS) par cardiopathie ischémique, tous âges: femmes pour 100 000 femmes	OMS
5.2.25	GISCO	Taux brut de mortalité par cardiopathie ischémique, tous âges: 1995 – pour 100 000 habitants	Eurostat
5.2.26	tableau	Décès (TMS) par maladie cérébrovasculaire, tous âges: hommes pour 100 000 hommes	OMS
5.2.27	tableau	Décès (TMS) par maladie cérébrovasculaire, tous âges: femmes pour 100 000 femmes	OMS
5.2.28	GISCO	Taux brut de mortalité par maladie cérébrovasculaire, tous âges: 1995 – pour 100 000 habitants	Eurostat
5.2.29	tableau	Décès (TMS) par maladie de l'appareil respiratoire, tous âges: hommes pour 100 000 hommes	OMS
5.2.30	tableau	Décès (TMS) par maladie de l'appareil respiratoire, tous âges: femmes pour 100 000 femmes	OMS
5.2.31	GISCO	Taux brut de mortalité par maladie de l'appareil respiratoire, tous âges: 1995 – pour 100 000 habitants	Eurostat
5.2.32	tableau	Décès (TMS) par suicide, tous âges: hommes pour 100 000 hommes	OMS
5.2.33	tableau	Décès (TMS) par suicide, tous âges: femmes pour 100 000 femmes	OMS
5.2.34	GISCO	Taux brut de mortalité par suicide, tous âges: 1995 – pour 100 000 habitants	Eurostat
5.2.35	tableau	Décès (TMS) par accident de circulation de véhicules à moteur, tous âges: hommes pour 100 000 hommes	Eurostat
5.2.36	tableau	Décès (TMS) par accident de circulation de véhicules à moteur, tous âges: femmes pour 100 000 femmes	Eurostat

3. Causes spécifiques de mortalité

5.3.1	tableau	Nombre absolu de décès principalement dus à des troubles mentaux liés à l'utilisation d'alcool, par âge et par sexe - 1996	Eurostat
5.3.2	tableau	Nombre de décès directement liés à la consommation de drogue, enregistrés dans les pays de l'UE	OEDT

6. SOINS DE SANTÉ

1. Ressources humaines

6.1.1	tableau	Population active dans le secteur sanitaire et social, hommes et femmes	Eurostat
6.1.2	tableau	Pourcentage de l'emploi dans le secteur sanitaire et social par rapport à l'emploi total	Eurostat
6.1.3	tableau	Nombre total de médecins	Eurostat
6.1.4	tableau	Nombre de médecins pour 100 000 habitants	Eurostat
6.1.5	GISCO	Nombre de médecins pour 1 000 habitants - 1995	Eurostat
6.1.6	tableau	Nombre de médecins par sexe (% du total) - 1996	Eurostat

6.1.7	tableau	Pourcentage de médecins par groupe d'âge et par sexe pour neuf pays de l'EEE – 1996 (% du total par sexe)	Eurostat
6.1.8	tableau	Médecins spécialistes, chiffres absolus	Eurostat
6.1.9	tableau	Médecins spécialistes, par million de personnes	Eurostat
6.1.10	tableau	Nombre total de dentistes	Eurostat
6.1.11	tableau	Nombre de dentistes pour 100 000 habitants	Eurostat
6.1.12	tableau	Nombre total de pharmaciens	Eurostat
6.1.13	tableau	Nombre de pharmaciens pour 100 000 habitants	Eurostat
6.1.14	tableau	Nombre total d'infirmières et de sages-femmes	Eurostat
6.1.15	tableau	Nombre d'infirmières et de sages-femmes pour 100 000 habitants	Eurostat
6.1.16	tableau	Nombre total de kinésithérapeutes	Eurostat
6.1.17	tableau	Nombre de kinésithérapeutes pour 100 000 habitants	Eurostat

2. Équipements et consommation

6.2.1	graphique	Proportion (%) d'enfants de moins de 2 ans immunisés dans les pays de l'UE – 1997	CIE/ OMS
6.2.2	tableau	Pourcentage de la population déclarant avoir subi des examens préventifs généraux, 1996	Eurobarom
6.2.3	graphique	Pourcentage de la population déclarant avoir subi des examens préventifs généraux, par groupe d'âge, EU-15, 1996	Eurobarom
6.2.4	tableau	Pourcentage de femmes déclarant avoir subi des examens préventifs spécifiques, 1996	Eurobarom
6.2.5	graphique	Pourcentage de femmes déclarant avoir subi des examens préventifs spécifiques, par groupe d'âge, EU-15, 1996	Eurobarom
6.2.6	tableau	Nombre total de lits d'hôpital (y compris en hôpital psychiatrique)	Eurostat
6.2.7	tableau	Nombre de lits d'hôpital (y compris en hôpital psychiatrique) pour 100 000 habitants	Eurostat
6.2.8	GISCO	Nombre de lits d'hôpital (y compris en hôpital psychiatrique) pour 1 000 habitants – 1995	Eurostat
6.2.9	tableau	Nombre total de lits en hôpital psychiatrique	Eurostat
6.2.10	tableau	Nombre de lits en hôpital psychiatrique pour 100 000 habitants	Eurostat
6.2.11	tableau	Hospitalisation au cours des 12 derniers mois (16 ans et plus) – 1994	Eurostat
6.2.12	graphique	Hospitalisation (en % de la population) au cours des 12 derniers mois par groupe d'âge – 1994 - EU-12	Eurostat
6.2.13	tableau	Nombre de nuits passées à l'hôpital au cours des 12 derniers mois, par sexe – 1996	Eurostat
6.2.14	tableau	Nombre de nuits passées à l'hôpital au cours des 12 derniers mois, par groupe d'âge, EU-12 - 1996	Eurostat
6.2.15	tableau	Sorties d'hôpital par principaux groupes de diagnostic (patients hospitalisés) – Taux par rapport à la population totale - 1997	Eurostat / OCDE
6.2.16	tableau	Durée moyenne du séjour à l'hôpital (en jours)	OCDE
6.2.17	tableau	Durée moyenne du séjour à l'hôpital pour le diagnostic principal (en jours)	OCDE
6.2.18	tableau	Admissions (soins cliniques) en % de la population	OCDE
6.2.19	tableau	Satisfaction en matière de services de santé - 1996	Eurobarom
6.2.20	tableau	Comportements concernant la fréquence d'utilisation des équipements de santé - 1996	Eurobarom
6.2.21	tableau	Opinion sur les institutions qui devraient être responsables des services de santé – 1998	Eurobarom
6.2.22	tableau	Équipements médicaux de haute technologie par million de personnes – 1997	OCDE

6.2.23	tableau	Nombre de consultations chez un généraliste, un médecin spécialiste ou un dentiste au cours des 12 derniers mois - 1996	Eurostat
6.2.24	graphique	Comportements concernant le temps consacré par les médecins à la discussion de mesures préventives et de modes de vie sains - 1996	Eurobarom
6.2.25	tableau	Médicaments/personne - Nombre de boîtes	OCDE
6.2.26	tableau	Achats de médicaments par type de médicament – Pharmacies de détail – 1999	IMS Health
6.2.27	tableau	Pourcentage de la population consommant des médicaments ou des vitamines sans ordonnance - 1996	Eurobarom

3. Traitements et actes médicaux

6.3.1	tableau	Césariennes pour 1 000 naissances vivantes	OMS
6.3.2	tableau	Transplantations d'organes, chiffres absolus	Eurostat
6.3.3	tableau	Transplantations d'organes, par million de personnes	Eurostat
6.3.4	tableau	Patients en dialyse, par million de personnes	OCDE
6.3.5	tableau	Interventions cardiaques	EHI

4. Coût et financement

6.4.1	tableau	Dépenses totales de santé en pourcentage du PIB	OCDE
6.4.2	tableau	Dépenses publiques de santé en pourcentage du PIB	OCDE
6.4.3	graphique	Évolution (1980-1995) des dépenses totales de santé et des dépenses publiques de santé en unités monétaires nationales aux prix relatifs du PIB de 1990	OCDE
6.4.4	graphique	Part des dépenses publiques dans le total des dépenses de santé, 1970-1997	OCDE
6.4.5	tableau	Dépenses totales de santé par personne, en SPA	OCDE
6.4.6	tableau	Dépenses totales en soins cliniques, en SPA par personne	OCDE
6.4.7	tableau	Dépenses totales en soins ambulatoires, en SPA par personne	OCDE
6.4.8	tableau	Prix constants - Consommation finale des ménages sur le territoire économique en millions de SPA spécifiques. Dépenses en soins médicaux et dépenses de santé. Ratio par habitant	Eurostat
6.4.9	tableau	Prix constants - Consommation finale des ménages sur le territoire économique en millions de SPA spécifiques. Appareils et matériels thérapeutiques. Ratio par habitant	Eurostat
6.4.10	tableau	Prix constants - Consommation finale des ménages sur le territoire économique en millions de SPA spécifiques. Services des médecins, infirmières et autres praticiens. Ratio par habitant	Eurostat
6.4.11	tableau	Dépenses totales en produits pharmaceutiques, en SPA par personne	OCDE
6.4.12	tableau	Prix constants - Consommation finale des ménages sur le territoire économique en millions de SPA spécifiques. Médicaments et autres produits pharmaceutiques. Ratio par habitant	Eurostat
6.4.13	tableau	Dépenses totales en prestations de protection sociale, de maladie, % du PIB	Eurostat
6.4.14	tableau	Dépenses en prestations de protection sociale: maladie/soins de santé, en SPA par personne	Eurostat
6.4.15	tableau	Dépenses en prestations de protection sociale: maladie/soins de santé, prestations en nature, en SPA par personne	Eurostat
6.4.16	tableau	Dépenses en prestations de protection sociale: maladie/soins de santé, prestations en espèces, en SPA par personne	Eurostat

6.4.17	tableau	Prestations sociales détaillées par fonction: maladie/soins de santé (tous systèmes). SPA par personne - 1996	Eurostat
6.4.18	tableau	Protection et amélioration de la santé publique en % du total des crédits budgétaires publics de R & D (budget final)	Eurostat

7. ANNEXES

POPULATION **1**

I. POPULATION

1. POPULATION STRUCTURE TRENDS: FEWER CHILDREN, MORE OLD PEOPLE

The total population in the European Union (EU) has increased from 340.0 in 1970 to 375.3 million in 1999. Since 1988 the rate of growth has slowed to about 1.5 million a year. The numbers of males and females in each age group are relatively homogenous up to the age of 55, but at older ages there are more women. The smaller number of children (0-14 age group) in 1998 is probably due to there being less women of child bearing age as result of the baby bust in the 1970s, and the general trend of delaying childbirth. The EU population growth is slowing down and the increase in population is based more on migration than a natural increase.

Decreasing birth rates and increasing survival have contributed to the rising numbers of older people in the EU. The proportion of those over 65 years of age and the very old (+80) have increased steadily over the past two decades. This 'ageing' of the population affects dependency. In 1998 the age dependency ratio for the EU was 49.3 aged 15-64. While in the short term the age dependency ratio is likely to remain fairly constant, it is expected to increase sharply again from the middle of the next decade as the proportion of people aged over 60 increases. The increase will be unevenly distributed across the EU countries over the next 25 years. The Netherlands and Finland will experience increases well above the EU average. According to baseline projections, Italy (119) and Spain (121) will have the highest age dependency ratios by 2050. This situation may have considerable implications for health policy and also for social protection and labour market policies.

The *natural population increase* is the difference between the number of live births and the number of deaths. The *net migration* is the difference between the number of immigrants and the number of emigrants. The *age dependency ratio* is an indicator calculated by Eurostat as the ratio of the number of people aged 0-14 and 65+ to those aged 15-64. It shows the extent to which the young (less than 15) and the old (over 65) are dependent on what is considered to be the active population (aged 15-64). It is assumed that those in the 15-64 age bracket support their younger and older citizens. The ratio is expressed as a percentage.

2. BIRTHS AND DEATHS; LIFE EXPECTANCY

The total fertility rate (TFR) (1.45 children per woman in 1998 in EU) is less than half that for the whole world (2.96) and is one of the lowest in the world. However it appears to have stabilised after years of decline due mainly to postponed motherhood and increasing childlessness. Ireland (1.93) has the highest TFR in the EU and Spain (1.15) has the lowest. The total fertility rate is a periodic indicator, reflecting both the timing and average family sizes of different generations of women. Replacement level fertility is approximately 2.1 children per woman.

In 1998, the number of live births in the EU reached the post-war low of just over 4 million. In the mid 1960s the annual number of live births were over 2 million higher, from 1965 to 1970 the number of live births decreased by 10% and have continued to fall. Since 1995 slight increases can be observed in some EU Member States. The highest number of births in 1998 can be found in Germany and the lowest in Luxembourg.

The crude birth rate in the EU was 10.7 per 1000 population, in 1998, declining from 18.3 per 1000 in 1996. Ireland has the highest crude birth rate 14.4 per 1000 and Italy has the lowest 9.0 per 1000.

In 1998, the number of deaths in the EU was 3.7 million, a 1% increase from 1997. The impact of the growing number of elderly people on deaths was fully compensated by decreasing mortality rates. With an aged population and a relatively less favourable mortality pattern, Denmark has the highest crude death rate, 11.0 per 1000, whilst Ireland has the lowest, 8.5 per 1000.

Eurostat has prepared projections to predict both population and mortality growth in EU countries. Using the baseline scenario they predict the proportion of young people in the total population, currently 24%, to decline until 2020. They predict this trend to follow in all EU countries, with the exception of Luxembourg, where the proportion of growth is expected to remain at present levels. Eurostat projects an increase in the proportion of elderly people in the EU. Increasing from 21% in 1998 to 27% in 2020. This trend will be apparent in all EU countries. Italy and Spain are expected to have the highest proportion of elderly people.

In recent decades life expectancy has increased significantly. According to current mortality, girls born in 1997, in the EU, may expect to live to 80.9 years and boys 74.6 years. The difference in the rates for the two sexes is particularly marked in France, where the life expectancy of a female child at birth is 7.6 years more than that of a male child. In Sweden the difference is only 5.1 years. Since 1960 life expectancy has increased in all EU countries. The countries in southern Europe have experienced increasing life expectancy at a faster rate than the Northern countries. Eurostat has used the mortality projections to estimate future life expectancy. Using the high scenario they expect men to reach 83 years of age in 2050 and women 87 years of age.

The *total fertility rate* is the average number of children that would be born per woman if all women lived to the end of their child bearing years and bore children according to a given set of age specific fertility rate.

The *crude rate* (births or deaths) is the number of events (births or deaths) to the mean of the population in a given year.

Eurostat calculates *life expectancy* as the average further number of years that a person of a specified age can expect to live, assuming that the age-specific mortality levels remain constant (i.e. the rates observed for the period under review). Life expectancy tables are based on the probability of dying according to Farr's death rate method: $q_x = M_x / (B_x + (M_x/2))$ where M_x is the number of deaths at the age of x to under $x+1$ years in the reported period; B_x is the average population aged x to under $x+1$ in the base period and q_x is the death probability from age x to $x+1$. *Life expectancy* is normally expressed as the number of years a person may expect to live, starting from age 0. Also other ages can be chosen as a starting point: The *life expectancy at a certain age* is the number of years a person of a certain age may expect to live, if mortality patterns remain unchanged. Life expectancy is normally calculated for all age levels and for males, females and total population.

LIFE STYLES **2**

II. LIFE STYLES

1. NUTRITION

The Recommended Dietary Allowances (RDA) for most EU countries ranges between 2 200 kcal and 2 900 kcal depending on certain personal characteristics. For example: the RDA is approximately 2 900 kcal for males aged 25-50 years who are 176 cm tall weighing 79 kg or 2 200 kcal for women (aged 25-50, 163 cm and 63 kg). According to data from FAOSTAT, the database from the Food and Agricultural Organisation (FAO), the daily average number of calories per person (expressed in kcal) in all the EU countries (except Finland) is approximately 3 000 kcal/day. The average daily calories in grams per capita according to type of food supply in 1997 shows that cereals excluding beer, meat, vegetable oils, alcoholic beverages and sweeteners provide most daily calories.

Daily fat intake should not exceed 30-33% of total energy intake. Recommendations from some food administrations (especially International Union of Nutrition Sciences) indicate that the intake of hardened fat, i.e. the sum of saturated fatty acids and trans-fatty acids (e.g. bakery products, chips and snacks), should contribute a maximum of about 10% of one's energy intake to avoid cholesterol problems. According to data from FAOSTAT the averages for most of EU countries exceed or are around this value.

The average daily fat in grams per capita according to type of food supply in 1997 shows patterns of consumption with prominence of vegetable oils, meat, milk and butter and animal fats. The EU average for the fat intake as a percentage of the total energy intake in 1996 was 39.0%. Denmark (42.8% and 181.2 g/day) and Austria (42.5% and 157.6 g/day), have the highest fat intake per day. Only Ireland (32.2% and 130.2 g/day) and Portugal (32.2% and 130.9 g/day) are close to the recommended values.

The Mediterranean countries (Greece, Spain, Italy and Portugal) had the lowest fat intake in the 1970s, this has since increased, their fat intake has become more in line with the other EU countries. There are underlying issues on changes in diet which can not be fully explored here.

In 1996, the percentage of total energy available from proteins in food for human consumption represented 12.2% of the average EU intake with wide variation throughout the EU countries. The RDA for adult men and women is 0.8 g/kg of body weight per day. Although protein is necessary for growth and the functioning of the body, how much protein a person requires is often overestimated. For best performance 10% to 20% of calories should come from protein. All EU Members are within these values. In the average western diet the most common sources of protein are animal products (e.g. hamburgers, bacon, eggs and dairy products) which supply the consumer not only with an abundance of protein but also high quantities of saturated fats and cholesterol.

Results of the Eurobarometer survey indicate that 19.0% of Europeans (24.7% of women and 13.0% of men) had followed a diet during the last 12 months in 1996. Greece had the highest proportion of women that had been on a diet in the last 12 months (36.7%), while only 17.7% of Swedish women had dieted. In the case of men: 19.7% from Luxembourg had dieted and only 8.2% in Ireland had dieted. In most cases the diet follows a personal decision (10.6% in EU) and only 5.7% of cases in the EU are as result of a doctors suggestion. Results also show that the highest proportion of women having dieted are in the 25-34 age group, whilst for men it is the 55-64 age group.

The Health Behaviour in School-aged Children (HBSC) has studied some aspects of the eating and dietary habits for school children aged 13-15. Results indicate that over most EU countries girls are more likely to

eat fruit than boys. This ranges from 50% in Norway to 95% in Portugal for girls, and from 35% in Norway to 91% in Portugal for boys. Chips or fried potatoes are consumed more by boys, especially in the UK, Greece and Belgium. Boys in general also tend to have a higher consumption of sweets or chocolate and soft drinks than girls across all EU countries. Results also show that girls aged 13-15 are more likely to report that they are on a diet or feel that they should be on a diet. In Austria 49% of girls reported that they feel the need to diet, in comparison to 30% boys. The lowest level of girls feeling the need to diet are in Ireland 37% in comparison to 26% of boys. The greatest difference between boys and girls is in Finland, where only 21% of boys felt they should diet in comparison to 47% females.

According to data from FAOSTAT, the database from (FAO), these indicators are calculated on total amounts of fat, proteins and calories available for consumption when converted into kilocalories or grams. Food available for human consumption is calculated using the official statistics on food production, imports, exports and stocks. The figures are probably biased due to the possible influence of food wastage during the distribution process and wastage in households before it is consumed. Food intake could be measured more effectively if real consumption surveys existed, but this is rather the exception than the rule, e.g. DAFNE (project for 6 countries) and the EPIC survey.

According to the International Union of Nutrition Sciences, dietary guidelines have been developed by national governments to provide information to assist their populations to make decisions about selecting a nutritious diet. Guidelines usually offer advice about selecting a nutritious diet using a variety of foods, based on national food supplies and dietary patterns. Since 1992 FAO and WHO jointly convened a consultation to prepare a *Food-Based dietary guidelines* involving experts from 22 countries.

Twice a year the European Commission conducts the Eurobarometer survey in order to gather information on the attitudes of the population towards EU and its policy. Each year additional questions about specific subjects are appended to the questionnaire. A two-stage sampling method is used. In the first stage a random selection of sampling points within each region is made in such a way that urban and rural areas are represented proportionally. This selection results in 1 350 sampling points. In the second stage interviews are distributed in these sampling points. Because quota sampling dominated, non-response figures are not available. However, the method of quota sampling is not completely random. People who are rarely at home are less represented in the sample but the interview sample can be considered as representative for the category of average citizens who are accessible at home and who agree to be interviewed. In each country the sample is 1 000 persons except Luxembourg (500). The small sample size results in large confidence intervals (CI). In breakdowns for age and sex, the number of observations in a cell may not exceed 50 leading to a large CI. Therefore, results must be interpreted with caution as they are not wholly representative of the EU.

The Health Behaviour in School-aged Children (HBSC) Study is a cross-national research study initiated by researchers of Norway, England and Finland, conducted in collaboration with the WHO Europe. The specific population selected for sampling in the 1997/98 survey were young people attending school who were aged 11, 13 and 15 with a recommended minimum sample size for each group of 1 536 students (a total 123 227 respondents) assuming a CI of 95% of $\pm 3\%$ around a proportion of 50% and a design factor of 1.2.

2. PHYSICAL ACTIVITY

Lack of adequate physical activity is one of many lifestyle factors related to a number of chronic diseases such as coronary heart disease, hypertension, colon cancer and diabetes mellitus. According to the Health

and Fitness Survey, from a list of 28 options the most popular physical activities in EU are walking, gardening, cycling and swimming. With increasing age, the rates of participation in all activities decreased with the exception of gardening and walking where the levels increased. Differences between men and women are not significant. The number of hours spent participating in various leisure physical activities in a typical week has significant inter-country variation ranging from around 10% of Finns declaring 0 hours of activity to approximately 60% of Portuguese.

As a measure of physical inactivity, respondents were asked about the number of hours they spent sitting. Almost half the EU sample spend between 2 and 6 hours sitting in their leisure time and a further 38% spend over 3 hours sitting. A quarter of the French compared to over a half of the Dutch sit for more than 3 hours. Portugal is the only country where 20% of respondents said not sit at all during their leisure time. Inactivity is higher depending the educational background of respondents.

The perceived barriers to increase levels of physical activity suggest that the majority of people in Europe are not active as a result of work/study (28%), or they perceive themselves as 'not the sporty type' (25%), this pattern is consistent across all EU countries. Only 10% of Europeans perceive themselves as being too old for exercise, but this varies from 3% in Finland to 21% in Greece. 11% of Europeans believe that poor health is a barrier to activity, this varies from 6% in Italy to 26% in Greece, however, most countries individual values are in line with the EU total.

In terms of physical activity at work, almost 50% of EU population spend 2-6 hours daily sitting at work and one fifth spend 6 or more hours. This pattern is true across all countries. The UK has the highest percentage of people sitting down at work for 2-6 hours, while Austria has the least. The Netherlands and France have the lowest levels of people not sitting down at work, while Finland and Luxembourg have the highest.

The questionnaire on attitudes to physical activity/exercise, body-weight and health, Health and Fitness Survey, was developed, with the support of the European Commission, by the Institute of European Food Studies in Dublin on 1997. The sample of 15 239 individuals throughout the EU was designed to be representative for most socio-demographic factors in each Member State.

3. SMOKING

Results from a Eurostat study show the percentage of smokers in the EU to range from 19.5% in Portugal to 41.5% in Denmark. In each country men are more likely to smoke with the exception of Sweden where 30.9% of women smoke in comparison to 29.9% male smokers. In the majority of EU countries the 35-44 age group has the highest percentage of smokers, then the 25-34 age group. In Ireland the highest percentage of smokers is in the 15-24 age group (40.8%).

However, results from the National Health Surveys (compiled by Statistics Sweden and by Eurostat) the general trend in smoking is declining for males and females in most EU countries for which data are available from 1970. It is worth noting that the prevalence of smoking among women is not decreasing with the same intensity as for men (especially in southern Europe). The prevalence of smoking among young people (aged 15-24) is also decreasing. According to the last available results (1994-1998) for the whole population, provided by Eurostat, Denmark (41.5%), Spain (38.5%) and the Netherlands (35.1%) have the highest rates and Portugal (19.5%) the lowest.

In 1995, results from the Eurobarometer survey provided the number of cigarettes per day for smokers and indicate that 30% were heavy smokers (i.e. >20 per day) and 2% were very heavy smokers (>40 per day).

The highest proportions of heavy smokers are to be found in Greece, Denmark, Belgium and UK. Based on WHO data, average number of cigarettes per person/year available on the market has decreased considerably in the last 15 years, especially in Finland, France, Sweden and UK. In other countries as Portugal, Ireland and Greece quantities per capita available on the market have increased at most by 20%, remaining relatively stable in the rest of Member States.

Statistics Sweden has used the recommended definition of WHO for the *proportion of smokers* (in %). This divides the number of smokers in the population being surveyed (via the existing National Health Surveys in the 15 Member States) by the total size of the survey population (smokers and non smokers). It is noticeable that, at the present stage, comparability between national health surveys is not fully achieved. A similar approach has been used for Eurostat for summarising results of National Health Surveys for the period 1994/1998. The average number of cigarettes per person/year available on the market in a country is defined by WHO as the result of dividing the cigarette production plus the cigarette imports minus the cigarette exports by the population of 15 years of age and over. Data are compiled by Tobacco Journal International and are used by WHO as a source.

4. DRINKING

The risk of cardiovascular disease and mortality in general can be related to alcohol intake. Alcohol drinking is also strongly associated with the risk of primary liver cancer; it increases the risk of upper digestive and respiratory tract neoplasms, and there is some epidemiological evidence linking alcohol drinking to cancers of the colon and of the female breast.

According to sales figures from each domestic market, the World Drinks Trend (NL) has calculated the average litres per person older than 15 of pure alcohol available on the market (beverages calculated according to their alcohol volume). Results show that Sweden, the UK and Finland have the lowest average alcohol sold with 7-9 litres per capita and year. France and Luxembourg have higher sales (about 15 litres, per capita), and the remaining EU countries sell between 10-12 litres. The EU average was 9.4 litres in 1996. No other recent statistics on the number of drinkers or patterns of consumption are available at European level for the moment.

According to the HBSC study, boys and girls (15 years of age) admitted to drinking alcohol at least once a week in 1997-98. In Greece more than 50% of boys admitted to drinking, in comparison to 31% of girls. Alcohol consumption is generally a lot higher for boys than girls. Children in Finland consume less alcohol than their European counterparts, 8% girls admit to drinking and only 11% boys.

According to Eurostat statistics on causes of death the absolute number of deaths due to alcoholic abuse (including alcoholic psychosis) in 1995 was 8 831 for men and 2 297 for women in the EU (*see mortality chapter*). Apart from these, a substantial number of deaths are related to alcohol abuse (such as some traffic accidents or liver cirrhosis) and are not included in this total.

Good comparative data on alcohol consumption is not available, these surveys are the best alternative sources of data.

The *average pure alcohol sold per capita* in a country is defined as the total amount of pure ethanol in spirits, wine and beer sold/ consumed in the country during the calendar year or calculated from official statistics on local production, import and export taking into account stocks and home production, whenever available. This amount is divided by the average-year population. Data published in World Drink Trends by Produktschap voor Gedistilleerde Dranken (Schiedam, NL) is used by WHO as a source.

5. DRUG USE

According to EMCDDA (European Monitoring Centre for Drugs and Drug Addiction) from 1994-98, cannabis was the most used illegal drug throughout the EU (an estimated 40 million people EU had tried it). Significant lifetime prevalence use of cannabis is highest in Denmark (31.3% for adults 18-69 years), even if its use is occasional and generally intermittent. Amphetamines appear to be the second most frequently used illegal drug, with the lifetime prevalence peaking at just 9.0% (UK for adults between 16-59). Lifetime prevalence use of cocaine ranges from 1 to 3% of all adults and 0.4-5% of young adults.

From the late 1980s many countries (Belgium, the Netherlands, Spain and UK) reported that ecstasy use, and in some cases LSD use, had become more popular among young people. European populations usually have less experience of heroin but among younger people in major cities heroin addiction can be much more prevalent than the national average. A tentative extrapolation from EMCDDA for the EU suggests somewhere between 3 and 5 million people in the EU have tried heroin at least once. Heroin remains a more significant problem in terms of public health and public safety. Crack smoking seems to emerge as a significant problem for the same group of people but no prevalence figures are available. Among young adolescents (15-16 years) the prevalence of solvent misuse is higher (8.7% in Sweden,) than abuse of any other drugs apart from cannabis.

Some national surveys indicate that illegal drug use is prevalent among schoolchildren and young people in more than half of Member States. Cannabis experimentation/usage among school children varies considerably between countries, from approximately, 1-2% in Portugal and Spain to over 45% on the UK. Amphetamines were the second most tried drug, but at a lot lower level than cannabis, the highest use being in Luxembourg (11%). Less than 10% of children over Europe have tried solvents, ecstasy, LSD, cocaine and heroin.

Data on the characteristics of persons treated for drug usage shows that across all the EU countries the majority of people being treated are under 25 years of age, and the majority are male. The mean age of treatment varies from 24.3 in Ireland to 37.4 in Belgium (Wallonia). Data shows the majority of people are being treated for opiates use (96% in Portugal – 27% in Finland).

Illegality and social disapproval make the populations involved difficult to reach and raise questions about the degree to which they will be candid. According to EMCDDA, since 1990 over half the 15 EU countries have mounted nation-wide surveys of illegal drug use in the general population, mainly on an *ad hoc* basis and over different designs, asking a representative cross-section of population whether they have used drugs. As applied to drug use, the method suffers important limitations, but for more common and less stigmatised drug-use patterns, such as cannabis use, surveys are feasible and potentially reliable. For rare and stigmatised forms of drug use, surveys need to be supplemented or replaced by other methods. Comparison is also hampered by different sampling and data collection methods and by analyses which use incompatible definitions and categories of measures. The situation is slowly improving because of the value of consistent series of surveys repeated at regular intervals as a trend indicator initiated by the EMCDDA.

6. SEXUAL BEHAVIOUR AND SEXUALLY TRANSMITTED DISEASES RISK

Initiatives for the prevention of sexually transmitted diseases, HIV and unwanted pregnancies have increased over the past decade. Results of the European Community concerted action on sexual behaviour & risks of HIV infection showed that on average 76% of men and 63% of women declared to have had a

lifetime experience of using a condom. The number of sexual partners is an important figure in the context of AIDS and sexual disease and can reflect differences in the sexual cultures by country. The number of partners during the last 12 months was surveyed in 11 of the EU countries. The majority of respondents had had only one partner, ranging from 62.8% in Spain to 87.8% in Athens for men and from 75.9% in Spain to 97.2% in Athens for women. Finland had the highest percentage of both men and women with more than one partner. The age of first intercourse is reducing over the generations, and is more marked in women than in men. The percentage of men and women having first intercourse at younger ages has increased over the generations. For men and women born in 1952 less people had first intercourse at ages 16 and 18 than those born in 1972. For example, in Finland, 20% of women born in 1952 had had first intercourse at age 16 in comparison to 35% in 1972. On the whole the possible effect of AIDS on the timing of first intercourse is more noticeable for men than for women.

Teenage pregnancies are an important public health concern, they can lead to social exclusion for teenagers and can pose health risks for both mother and child. To measure the level of teenage pregnancies we have to look at both births and abortions data. We cannot provide a true picture here as data on births and abortion is not available for all EU countries. The level of teenage birth rates is variable across the EU in 1996 ranging from 22.9 births per 1000 women aged 15-19 in the UK to 4.1 per 1000 in the Netherlands. Data for teenage abortions show for five Member States reporting a total of almost 50 000 legal abortions. Comparisons of national figures must be made with caution as each country has different methods of reporting and recording births and abortion data. Also difference in cultures between the EU countries could have an effect on the level of teenage pregnancies.

In terms of preventive measures against AIDS transmission, the Eurobarometer Survey in 1989, 1990 and 1995, asked people about certain preventive measures considered as being useful against AIDS. In certain EU Members (Spain, Italy and Portugal) general knowledge on efficacy of useful preventive measures seems to be low in comparison to the overall EU knowledge of 95%. In 1995 still 8% of Europeans believe (wrongly) that oral contraceptives are useful as a barrier against AIDS, and 17% believe (wrongly) spermicides to be effective.

To avoid risk of AIDS infection, 47% of Europeans knew that taking preventive action in sexual relations reduced the risk of contracting AIDS. 26% of people believe (wrongly) that avoiding certain places will reduce risk. This ranges from 8% in the Netherlands to 35% in Portugal. This data highlights the need for increasing people's awareness of HIV and AIDS.

The European Community concerted action on sexual behaviour & risks of HIV infection was carried out by the Facultés universitaires Saint-Louis (Belgium) with the support of BIOMED Programme of European Commission in order to study some questions regarding sexual life in national surveys in EU Members. The national surveys used generally are designed with a wide diversity of data collection and sampling techniques which hampers the comparability. The surveys (16 for 11 countries) were carried out in different years and periods.

7. OTHER LIFE STYLE FACTORS

Data on normal exposure to the sun is not available, but it is possible to know the number of times that Europeans have used UV-rays with an artificial sun bed or sun lamp. According to the results of the Eurobarometer 46.0 Survey, 18.3% of Europeans in 1996 admitted that they had exposed themselves voluntarily to UV-rays, 21.4% in the case of women and 12.9% in the case of men. These rates are particularly high in Northern Europe, especially in Sweden, the Netherlands, and Denmark, with averages of between 1 and 19 exposures per year. Women tend to have higher exposure to UV rays than men.

2.1.1 % of total energy available from fat in food for human consumption (1)

IV = intravenous,

(1) for D, I and L: intravenous refers to heroin

(2) in some countries amphetamines includes ecstasy

(3) IV = currently injecting the drug

(4) Data refers to specialised centres only. IV refers to currently or previously injecting.

(5) Data refers to specialised out-patient centers

III. RISK ASSOCIATED WITH ENVIRONMENT. WORKING CONDITIONS, LEISURE AND TRAFFIC

1. ENVIRONMENT

Studies indicate that even a very low concentration of suspended particles can provoke adverse health effects, e.g. increased risk of death through heart and lung disease. Studies also indicated that children are particularly vulnerable for lower respiratory illnesses when exposed to short-term pollution episodes. For this reason data on exposure to polluted air and other substances are related, at a larger scale, to emissions. Sulphur oxides (SO_x), nitrogen oxides (NO_x), carbon oxides (CO_x), volatile organic compounds (VOC) and ammonia (NH₃) are major pollutants contributing to air quality problems at local, national and international levels. In past decades, the emissions of SPM (suspended particulate matter) and SO₂ were highly correlated so the concentrations of both pollutants in ambient air were also correlated. Consequently, until the mid-1980s most epidemiological studies considered the health effects of both components jointly. The levels of industry and motor vehicles as sources of SPM pollution has increased, while SPM and SO₂ pollution due to incomplete coal combustion has decreased in many locations.

According to Eurostat, the total emissions in kg SO₂ per capita have been reduced in all EU countries since 1980 by 70% (from 73 to 27kg per capita). Emission levels vary from 9kg per capita in the Netherlands to 52kg per capita in Greece. Only Greece records an increase of emissions from 1980, Finland records the largest decrease in emissions from 122kg per capita in 1980 to 21kg per capita in 1996. The total emissions in kg CO₂ per capita have remained relatively stable since 1980. Emissions for all EU countries in 1996 are similar to the EU total 8kg per capita. Luxembourg has the highest emissions, which have decreased slightly from 27kg per capita in 1985 to 21kg per capita in 1996. Portugal has the lowest recorded emissions at 4kg per capita, which has remained stable since 1985. Total emissions in kg NO_x per capita have decreased for EU from 36kg per capita in 1980 to 32kg per capita in 1996, a decrease of 11%. However, not all EU countries have experienced a fall in the level of emissions. Emissions levels have more than doubled in Portugal from 17kg per capita in 1980 to 37kg per capita in 1995. Levels in Greece have increased by 56% from 23kg per capita in 1980 to 36kg per capita in 1995. In contrast, emission levels in Germany have fallen by 49% from 43kg per capita in 1980 to 22kg per capita in 1996. The countries in Northern Europe tend to have reductions, whilst those in Southern Europe are increasing.

The emissions of non-methane volatile organic compounds contribute to the formation of photo-oxidants and are responsible for photochemical smog, especially in summer. The amount of emissions declined in EU by 17% between 1980 and 1996. The decline in emissions, however, was only evident in 6 of the EU15 countries, noticeably in Belgium, decreasing 52%. Portugal saw an increase of over 3 times the levels in 1980 from 9kg per capita in 1980 to 31kg per capita in 1994. According to the Öko Institute in Darmstad (BRD), the as-TEQ weighted emissions of heavy metals to air describes the emission of arsenic, cadmium, chromium, copper, mercury, nickel, lead, selenium and zinc during key processes (e.g. combustion) having a high carcinogenic potential or a long term toxicity. The indicator shows a significant reduction from 1985 to 1995. Large reductions have taken place in the transport sector and in former East Germany due to increased use of filters to remove particles from exhaust gases.

The population connected to a sewerage system was 82.9% in EU in 1990, with only Portugal (55.3%) and Ireland (66.0%) being lower than the European average. The percentage of non-treated wastewater has decreased since 1970, but there are still areas where most of the population is not connected to sewage treatment. There is very little data available on connection to sewerage and treatment of water. No recent data is available and data that is available is incomplete so figures must be interpreted with caution.

Comparing the 1980 and the 1992 OECD data on the percentage of population exposed to noise due to road traffic, shows reductions of exposure in 5 of the EU12 countries. The largest reduction is seen in Finland and the Netherlands. There has been no change in noise exposure for residents in Belgium, Spain and Austria. Noise exposure has increased only in Germany.

Data on *sulphur oxides (SO_x)*, *nitrogen oxides (NO_x)*, *non-methane volatile organic compounds (NMVOC)* and *carbon dioxide (CO₂)* are obtained from the MS via the joint Eurostat-OECD questionnaire on the state of the environment. Data for EU-15 are, sometimes, Eurostat estimates. All data in this area are based on complex estimation and modelling procedures (such as EMEP/CORINAIR and IPCC) and are subject to several sources of error. The calculations are typically based on activity or fuel consumption data, multiplied by an emission factor. For CO₂ estimates have been calculated from Eurostat's own energy balance sheets covering only emissions from fossil fuel combustion (excluding gas flaring). For the *index of heavy metal emissions to air*, the heavy metal arsenic was used as a reference substance (1 g As = 1 g As-TEQ). The As equivalence factor for lead is increased by a factor of 10 in the case of motor vehicle emissions because of the resulting of high ambient air concentration.

The data from Eurostat on *population served by wastewater treatment plants* through a public sewerage network and the population connected to sewerage system provide information on the level of equipment installed by countries to abate pollution caused by emissions to water. The data from TAU (Spain) on *non-treated wastewater* is the percentage of total wastewater, which is discharged to surface water without being first submitted to treatment.

The OECD indicator on *people endangered by noise emissions* provides insight into the pressure from noise emissions. It shows the percentage of population exposed to noise levels greater than 55 dB(A) and 65 dB(A) at a national scale. Levels exceeding 55 dB(A) are harmful to the quality of life and to general well being and health. Levels exceeding 65 dB(A) are unacceptable for residential environments because of serious harmful effects on communication, sleep and rest, performance and on long term health. Levels above 75 dB(A) are considered a direct threat to human health. Data refer primarily to road traffic.

2. WORKING CONDITIONS

According to the European Statistics on Accidents at Work (ESAW), in 1996 the number of accidents at work resulting in more than three days' absence in the EU as a whole is estimated at 4.76 million. In the same year, there were 5 549 fatal accidents at work in the Union. These 1996 European statistics on accidents at work cover 131.9 million persons in employment. The European incidence of accidents at work resulting in more than three days' absence per 100 000 persons in employment is thus 4 229. There are an average 5.3 fatal accidents at work per 100 000 workers (total deaths), and 3.6 excluding road traffic accidents and deaths from strictly natural causes which occurred during working hours. The construction industry has the highest frequency of accidents resulting in more than three days' absence: 8 023 per 100 000, almost double the average. Fatal accidents at work (including road traffic accidents and natural causes) are more than twice as frequent as the overall average in construction (13.0), agriculture (13.0) and transport (12.0). The frequency of fatal accidents at work (excluding road traffic accidents and natural causes) ranges from 3 to 6 per 100 000 from the north to the south of Europe.

Men are three times more likely to have an accident than women, and ten times more likely to have a fatal accident: 5.458 accidents resulting in more than three days' absence and 7.7 deaths per 100 000 (including road traffic accidents and natural causes), compared with 1 924 accidents and 0.8 deaths per 100 000 respectively

for women. This is a result of the function of men's jobs and sectors of activity, which are more high-risk than those of women. There are also relatively more women who work part-time, thus reducing their exposure to risk.

The frequency of accidents resulting in more than three days' absence decreases with age: 5.751 accidents per 100 000 for the 18-24 age group, 4 390 for the 25-34 group and 3 558 for the 45-54 group.

However, the frequency of fatal accidents increases considerably with age: 3.8 for the 18-24 group, 4.2 for the 25-34 group, 4.7 for the 35-44 group and 6.3 for the 45-54 group. Unlike accidents resulting in absence, the economic activity is also a factor in this age-related pattern of fatal accidents at work: 47% of workers in agriculture are over 45 and 28-31% in the other branches with a high risk of fatal accidents (construction, transport and, to a lesser extent, manufacturing). They represent only 22-26% in the other common sectors of activity (29% on average in the eight branches). Other factors such as the workstations occupied, experience and age-related patterns of behaviour and vigilance may also have an effect on the risk of accidents at work.

Analysis on the part of body injured, shows that in 1996, 67.3% of injuries were to limbs, of which a third were to the hands. Three-quarters of fatal accidents were due to injuries to the whole body (33.3%) or to the head (27.5%) or torso (9.9%).

European Statistics on Accidents at Work (ESAW) data collected by Eurostat covers accidents at work resulting in more than three days' absence and accidents resulting in the death of the victim. They are compiled mainly from national administrative sources, the concepts and definitions are harmonised, in accordance with Council Directive 89/391/EEC of 12 June 1989 (improvements in the safety and health of workers at work). These statistics include accidents caused by third parties, road traffic accidents during working hours and acute poisonings, but not accidents on the way from home to work or occupational diseases.

The reporting level is the number of accidents reported as a percentage of those that actually occurred. The 9 Member States in which it is compulsory to report accidents at work in order to qualify for treatment under social security or insurance schemes record all accidents at work with more than three days' absence. In contrast, accidents at work are only partly recorded in Denmark, Greece, Ireland, the Netherlands, Sweden and the UK. For these 6 countries, Eurostat calculates the actual number of accidents: the estimated number of accidents with more than three days' absence is the number of accidents reported adjusted by the reporting level below 100%. The incidence rate is the (actual) number of accidents at work per 100 000 persons in employment. For 1996 the frequencies are calculated only for the 9 branches of activity (NACE Rev. 1 sections) covered by all 15 countries: agriculture, hunting and forestry - manufacturing - construction - wholesale and retail trade and repairs - hotels and restaurants - transport and communication - financial intermediation - real estate, renting and business activities - other branches of activity. However, the coverage is not yet complete for agriculture and transport: non-wage earners (the self-employed, family workers etc.) in agriculture and rail, sea and air transport. The frequency for Europe as a whole is calculated excluding the self-employed, employers and family workers in the UK (accidents with more than three days' absence) and excluding the Netherlands (deaths). Moreover, the structure of a country's activities influences its total frequency. To correct this effect, a "standardised" number of accidents at work per 100 000 persons in employment is calculated per Member State by giving each branch the same weight at national level as in the EU total. For fatal accidents, the results by Member State (numbers and frequencies) do not include road traffic accidents during working hours (e.g. lorry drivers, business journeys), which are recorded as accidents at work by only 13 countries. Similarly, they do not include deaths from strictly natural causes during working hours (e.g. heart attacks), which are included only by Spain and France. In contrast, all deaths are taken into account in the European-level study.

3. HOME AND LEISURE ACCIDENTS

According to the data coming from the EHLASS (European Home and Leisure Accident Surveillance System) from the European Commission, an estimated 430 000 home and leisure accidents occurred in the EU in 1995 (243 000 to men and 190 000 to women). Comparisons between countries are hampered by different types of national collection of data. For the whole of the EU, in the case of men and according to the place of the accident, it is estimated that accidents at home (32%) were the most frequent followed by sporting accidents (18%), around the home (12%), in transport areas (11%) and in educational areas (7%). Boys less than five years accounted for 13% of cases and men over 65 years for 6% of cases. In the case of women, accidents at home (46%) were the most frequent followed by accidents in transport areas (14%), around home (10%), during sport (10%) and in educational areas (7%). Girls less than five years accounted for 12% of cases and women over 65 years for 16% of cases.

According to the type of activity for men, it is estimated that accidents at play and leisure (30%) were the most frequent followed by sports (12%), DIY (do-it-yourself) activities or gardening (8%) and other educational activities (7%). For women accidents on play and leisure are also the most frequent (31%), followed by basic personal needs (12%) and household accidents (10%).

The most frequent type of injury in case of men is open wounds and cuts (25%) followed by contusions (23%), fractures (13%) and distortions (9%). In case of women it is contusions (25%) followed by open wounds and cuts (18%), fractures (17%) and distortions (10%).

The *EHLASS (European Home and Leisure Accident Surveillance System)* was introduced by the Council Decision 93/683/EEC of 29 October 1993 introducing a Community system of information on home and leisure. Since 1999 the EHLASS system has been integrated into the Community Programme of Prevention of Injuries. According to the principle of subsidiarity, the Member States are in charge of implementing the system and collecting the data, and are also responsible for the quality of the data (with special attention to the representativity of the hospitals, to the interval between surveys and to the extent of the samples - Decision 3092/94/EC, Annex 1 § 4). Member States process the data collected and submit annual reports to the Commission. The EU provides financial support. The basic information is obtained by two different means: from casualty departments of hospitals selected by the Member States (this is the case for most of the countries) and by means of household surveys (Germany, Spain and Luxembourg). This surveillance system concerns the home and leisure accidents. An accident, according to the WHO definition, is *“any event, independent of the will of man, characterised by a sudden release of an external force, which can manifest itself as body injury”*. The Home and Leisure Accidents exclude road traffic accidents, occupational accidents, sudden illness, suicides and cases of violence (except childrens' brawls) and include school accidents and cases due to animals (bites, stings, etc.). The cases in which data are collected includes different types of Home and Leisure Accident, including those accidents needing treatment or medical care when a victim goes to a general practitioner or to a hospital. According to different type of surveys in the EU countries, when the data are collected from the departments of hospitals, only these cases are concerned. When the data are collected from home surveys, they can vary depending on the methodology adopted.

4. ROAD TRAFFIC ACCIDENTS

The number of deaths caused by road accidents can be used as an indicator to assess the safety as result of a complex interaction of quality of road, quality of cars and human behaviour. All accidents are considered

here including pedestrians, cyclists, motorists and passengers. However, despite the existence of an international standard, not all Member States record road deaths in the same way.

According to regional Eurostat data, in 1996, almost 40 955 people lost their lives on the roads of the EU. Between 1989 and 1997 the number of deaths due to road accidents declined by nearly 14% on average. There was an improvement in almost all Member States. In terms of NUTS-1 and NUTS-2 regions, the most deadly regions with a number of deaths in road accidents per million inhabitants higher than 227 were the Alentejo (P), Algarve (P), the Luxembourg region in Belgium (not the Grand Duchy), Centro (P), Brandenburg (D), Sterea Elada (EL), Dytiki Ellada (EL), Kriti (EL), Kentriki Ellada (EL), Bourgogne (F), Castilla-La Mancha (E), Mecklenburg-Vorpommern (D), Balears (E), Castilla-León (E) and Peloponnisos (EL). NUTS data can be seen in more detail in the attached maps. This data on road deaths can differ from those in *Chapter 5* because the notification systems are not fully comparable (*see box*).

Data on the number of people injured by road accidents per 100 000 people in EU collected by the United Nations Economic Commission for Europe does not follow the same trends as the data on deaths. The sources and methods of collection are different, and comparisons of injury and death trends are not significant. The EU-average accident rate was 479.8 in 1997 - a slow decrease when compared with 1985 (498.7) and 1975 (544.7). Belgium (696.0), Portugal (688.3) and Austria (652.8) are the most affected by road injuries. Finland (182.8) and Denmark (191.3) have the lowest average. There is a contrast in certain countries between the lowest average for road injuries in contrast and high one for road deaths. This is especially the case of Greece.

Deaths in road accidents are people who were killed outright or who died within 30 days as a result of the accident. They are collected by *Eurostat* (regional statistics) and can be calculated as a standard death rate (SDR) on the basis of WHO-reference population. All Member States should follow the international standard of 30 days established by the ECMT (European Conference of Ministers of Transport, an OECD body) but big differences remain in the time taken into account by Member States after an accident. The data on *occurrence road traffic accidents with injury* and data on *persons injured in road traffic accidents* are obtained from the Statistics on Road Traffic Accidents in Europe (United Nations Economic Commission for Europe). The data are generally in accordance with the commonly agreed definitions which have been worked out under the auspices of the Inland Transport Committee of the UN Economic Commission for Europe.

The Nomenclature of Territorial Units for Statistics (NUTS) was established by Eurostat to provide a single uniform breakdown of territorial units for the production of regional statistics for the EU. Although the NUTS classification has no legal value *per se*, it has been used since 1988 in Community legislation (Council Regulation (EEC) Nr 2052/28 on the tasks of structural funds). The NUTS nomenclature serves as a reference for the collection, development and harmonisation of EU regional statistics, for the socio-economic analyses of the regions and for the framing of EU regional policies.

(1) Number per 100 000 persons in employment : e = (d / a) x 100 000 then standardisation and g = (f / a) x 100 000 then standardisation.
 (2) The euro zone (EUR-11) consists of Belgium, Germany, Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland.
 (3) Public insurance (social security) or private insurance, depending on Member States.
 (4) Usually the Labour Inspectorate.
 (5) Italy: 100% except for the self-employed in craft professions: 65%; Austria: 100% except for agriculture and public administration - the 1994 data included accidents with 1 to 3* days absence, and this is no longer the case in 1996; Portugal: almost 100%; the Netherlands: <30% or 30 to 70% depending on the branch of activity; Norway: between 25 and 100%.
 (6) 1996: Portugal and Norway = 1995 data; the Netherlands = 1994 data; Portugal: the 25-34 year range includes the ages 35-44, and the 45-54 year range includes the ages 55-64.
 (7) Except for Ireland and the United Kingdom which do not have data on this type of accident; the Netherlands (excluded from the incidence calculation): only immediate deaths.
 (8) National breakdown by age drawn up as a proportion of the national division by age which includes road traffic accidents and accidents on any means of transport during work.

3.2.3

Accidents at work in 1996 in the EU and Norway (1) by sex and part of body injured

	Work accidents with more than 3 days' absence EU and Norway (1)		Fatal work accidents EU (1)	
	number all branches	structure in %	number all branches	structure in %
Head	451 437	9,3%	1527	27,5%
Neck (2)	97 999	2,0%	113	2,0%
Back (2)	341 970	7,1%	189	3,4%
Torso (2)	246 332	5,1%	548	9,9%
Limbs (2) Upper	1 972 558	40,8%	72	1,3%
Lower	1 280 234	26,5%	113	2,0%
Whole body (2)	131 542	2,7%	1847	33,3%
Others (3) and not specified	310 257	6,4%	1140	20,5%
Total	4 832 329	100,0%	5549	100,0%

(1) Data on accidents at work with more than 3 days' absence are also available, according to ESAW methodology, for Norway and are included in this table;
No data on fatal accidents at work are available for Norway.

(2) Neck and back: include spine and vertebrae; torso: includes internal organs of the rib cage and abdominal area;
limbs: include hands (upper limbs) and feet (lower limbs); whole body: includes multiple sites of the injured body.

(3) Including deaths having only a medical origin occurring during work in France (not applicable for all other countries).

Road safety: Number of deaths per million inhabitants in the regions of the EU - 1996

HEALTH STATUS 4

IV. HEALTH STATUS

1. SELF PERCEIVED AND MEASURED HEALTH

Perceived own health

An analysis of the health data in the European Community Household Panel (ECHP), first wave 1994, revealed that two out of three Europeans aged 16 and over and not living in institutions perceive their own health as 'good' (44%) or 'very good' (23%). Although the question on perceived health may be sensitive to differences in language and 'culture' between Member States, it seems worth noting that, for instance, 'very good' health is reported by as many as 53 % of the Danish and as few as 8 % of the Portuguese population. The negative responses 'bad' and 'very bad' to the perceived-health question are most frequent in Portugal, Spain and Italy. At EU12 level (very) bad health is perceived by approximately 1-2% among the youngest age groups and rises to 35% among the elderly; it is somewhat more frequent among women than among men.

In recent years socio-economic health differences, i.e. differences in health status between population groups with different socio-economic status, are one of the phenomena frequently studied. International comparisons are however hampered by scarcity of internationally comparable data. With respect to indicators of socio-economic status at EU12 level, the EUR graphs on 'perceived health' show clear differences: for men as well as for women education and health problems are negatively related. In addition, men have a higher perception of their health than women do, while in the groups with higher education there is practically no difference between men and women's perceptions. Looking at the figures for men in calculations based on education, we find significant odds ratios for all health variables in all countries except Luxembourg (where confidence intervals are relatively large because of the small sample size). The figures for women also show significant socio-economic differences for all health variables in practically all countries, but here there are a few more exceptions; not only in Luxembourg, but also in Germany and to a lesser extent in the Netherlands.

We can say that the picture is somewhat mixed: most countries score in two of the three categories large/medium/small differences. Nevertheless, it can be said in summary that socio-economic health differences as found in the ECHP are relatively large in Ireland, Denmark, Greece and Spain, Portugal and the UK, they are moderate in Italy, Luxembourg and the Netherlands and smallest in Germany and Belgium.

The [ECHP] is a longitudinal, multi-subject survey covering many aspects of daily life, particularly employment and income, but also demographic characteristics, environment, education and health. The three essential features of the ECHP are (i) simultaneous coverage of many aspects of daily life, (ii) a standardised methodology producing comparable information for the Member States of the EU, and (iii) a longitudinal or "panel" protocol. The ECHP was designed to complement the two main social surveys co-ordinated at EU level - the Labour Force Survey and the Household Budget Survey. In all, the sample covers some 60 000 households comprising 130 000 adults aged 16 or over at 31 December of the previous year. The first waves took place in 1994 (Wave 1), 1995 (Wave 2) and 1996 (Wave 3). The ECHP survey was undertaken when the EU had only 12 Member States, so Austria, Finland and Sweden were not included in the first wave (1994). The health section of the ECHP contains questions on *perceived health, being hampered in daily activities because of chronic conditions, temporary reduction (last two weeks) of activity because of health problems and hospitalisation in the 12 months preceding the interview*. In health statistics, age is an important variable, since the occurrence of many health problems increases with age. To obtain comparable

figures, age standardisation to the European population was used to adjust for any differences in the age distribution between European countries.

On *socio-economic health differences*, figures are standardised for age by means of a regression procedure; all 'pillars' in the graph rest on the same age distribution, and comparisons are not hampered by the fact that, in reality, the different educational levels have different age distributions. As usual for this type of analysis, the health variables are dichotomised: both the variables 'perceived health' and 'hampered by chronic conditions' were re-coded into two dichotomies (this is to check on whether the choice of the 'cut-off point' has an influence on the conclusions). For education as well as income, these summarise the difference between the two lower groups versus the two upper groups.

Anthropometric characteristics

The average height of the EU population has been increasing over the last century, more so during the past few decades. In developed countries, height increases have come to be seen as a measure of the health status of the population. A question about height was included in the 1996 Eurobarometer. The average height of European women is 1.635 m, this average varies considerably across EU countries. Women in the Netherlands and in Denmark are the tallest in EU with averages of 1.680 m and 1.664 m respectively, while Spain and Portugal have the shortest average of 1.612 m and 1.599 m respectively. While average height differs considerably within the EU, all countries have experienced an increase in height in the population. Older cohorts (i.e. women 65 years or older) are considerably shorter than younger cohorts (i.e. women 15-24 years old), which confirms the increasing height over time. Similar trends are evident in case of men. The average height of European men is 1.754 m. Men in the Netherlands and in Denmark are the tallest in the EU with averages of 1.796 m and 1.785 m respectively, while again Spain and Portugal have the shortest average height of 1.717 and 1.694 m respectively. Older cohorts (i.e. men 65 years older) are considerably shorter than younger cohorts (i.e. men 15-24 years). The difference between the shortest and the tallest population in the EU is approximately 8 cm for women and 10 cm for men.

A question about weight was also included in the 1996 Eurobarometer survey. The average weight for European women is 64.6 kg, with the highest averages in the Netherlands (68.3) and in Greece (67.0) and the lowest in France (61.1) and Italy (61.3). The average weight of European men is 77.9 kg. Men in West Germany, Sweden and Great Britain have the highest average weight, while again France and Portugal have the lowest average weight. All countries have also experienced an increase in the weight of the population according to age, the top weight normally being reached in 45-54 years and decreasing thereafter, but this trend is not as evident in men as it is in women. The difference between the highest and the smallest average weight in the EU is approximately 7 kg for women and 8 kg for men.

Health risks [e.g. cardiovascular diseases (in particular ischaemic heart diseases, and hypertension), diabetes and others] increase considerably when the actual Body Mass Index (BMI) exceeds the desirable BMI by more than 20% (or when BMI exceeds 27) and increases rapidly with a BMI of 30 and over. Most Europeans have a 'normal' BMI (between 20-27); (69.5% of men and 64.6% of women). However, 6.1% of men and 6.9% of women are severely overweight and 0.9% of men and 3.1% of women are severely underweight. Considerable differences exist within the EU for women. Greece and the UK have the highest levels of severe obesity (BMI>30) while Germany and Sweden have the lowest. Severely underweight cases are the most frequent in Luxembourg, and Belgium. In the case of men Greece and Portugal have the highest levels of severe obesity while the Netherlands, and Italy have the lowest. For men, being underweight is less of a problem: only UK (2.1%) and Belgium (1.9%) have higher than European averages.

The *Body Mass Index* (BMI) or *Quetelet's index* is a measure of a person's weight relative to his or her height that correlates fairly well with body fat content in adults. The BMI is accepted by experts as the most useful measure of obesity in adults when only weight and height data are available. BMI is calculated for each respondent (of the Eurobarometer survey in this case) as the result of dividing body weight (in kg) by body height (in m) squared. If the result is between 18 and 20 the person is underweight, and is severely underweight when below 18. A person with a BMI between 27 and 30 is overweight and severely overweight with a BMI of 30 or more. There is no international consensus about the classification of moderate obesity and a range of 25-30 is sometimes used.

2. DENTAL HEALTH

There are many factors involved in the aetiology of dental caries. According to the WHO, during the past twenty years dental health has improved considerably in EU following the results of a school survey on DMFT index (decayed, missing and filled teeth) at age 12. DMFT decreases in the EU from 4.8% in 1980 to 3.4% in 1990.

According to the Eurobarometer 1996 results, 75.4% of Europeans are very or fairly satisfied with her/his own teeth, dentures or false teeth and only 12.5% are very or fairly dissatisfied. No differences exist between men and women. The highest level of satisfaction with own teeth, dentures or false teeth is found in Denmark (88.9%) and the lowest in Greece (58.5%). Satisfaction decreases with age from 82.2% at 15-24 age group to 69.9% for those aged over 65 years old. There are no significant differences between men and women. However, only one question on satisfaction with teeth, dentures or false teeth was used in the survey, restricting data for analysis.

According to the patterns of nutrition found in the Health Behaviour in School-aged children (HBSC) from WHO (11-13 years of age) and considering the number of students who eat chocolate and sweets daily, the importance of brushing teeth more than once a day cannot be ignored. Students in Sweden, Denmark and Switzerland are most likely to brush their teeth more than once a day with levels of 80%. In contrast, less than half of students in Flemish Belgium, Finland and Greece do not. Girls brush their teeth more frequently than boys.

3. DISABILITY AND RESTRICTIONS

Impairments, Disabilities and Handicaps

In 1993, Eurostat collected disablement statistics following the old version of the International Classification of Impairments, Disabilities and Handicaps (ICIDH) (*see box*). The mix of data from registrations and surveys allows rough estimates to be made. Estimations show the number of persons with an impairment to be very high. An impairment does not always lead to a disability. The number of persons with a disability is therefore lower. As far as the breakdown by sex is concerned, the existing data shows a higher rate of disability among women, partly as a result of their longer life expectancy. The estimated number of persons with a disability, as a proportion of the total population varies between 9% and 15%. However, most Member States have close to 12% of people with a disability. This variation may be due to methodological differences concerning the definition (impairment-disability-handicap), the method of identifying persons (survey or social security sources), the age structure in the population and the technological and industrial characteristics of each Member State (the rate of occupational accidents varies according to the sector of activity). The percentage of persons (not retired) receiving financial aid related to a disability varies between

3% and 7% of the total population (aged less than 60), most of the Member States have a figure between 4 and 5%. There are a relatively small number of women among the beneficiaries of pensions paid to active persons. On the other hand, more women than men receive social aid allowances. The difference is significant for occupational accident pensions, because men have a higher rate of professional activity and there is a higher concentration of male labour in certain industries where the occupational accident rates are relatively high.

The ICIDH is being revised by the WHO. The old version was based on a typology of the three dimensions of disability in the broad sense: Impairment (any loss or abnormality of psychological or anatomical structure of a function), Disability (a restriction or lack of ability to perform an activity in the manner or within the range considered normal for a human being) and Handicap (a disadvantage for a given individual, resulting from an impairment or a disability). Data presented here on impairments, disabilities and handicaps are based on the old ICIDH and are available only for a part of the 15 Member States, but they are often quite old and difficult to compare. Estimates were used on the basis of data from surveys, giving us the proportion of persons with a disability by age group in the total population. As a stable relationship was observed between this proportion and age, this information was used to estimate the population of persons with a disability for recent years (Germany, Spain, France, the Netherlands and the UK). For those Member States for which no findings from surveys were available, social security data and data from the various services providing aid to disabled persons were used (Belgium, Greece, Italy, Portugal). To include all populations with significant disabilities, information from a variety of sources were used, (registers of persons receiving disability, occupational accident, occupational illness and social service pensions, disabled children's allowances, elderly person's special invalidity benefits, war pensions, etc.). For some Member States (Luxembourg and Ireland) not enough information was available to make such estimates.

The new version of ICIDH is based on three dimensions of functional state: Function and shape of the body (for which two classifications are being developed, one for functions of body systems and one for the shape of the body and body parts), Activity (formerly disability, defined now as limitation in activities) and Participation (formerly handicap, defined now as restriction in participation). A list of environmental factors is added to the new classification as an extra component.

Restriction or cutdown in daily activities

Analysis of the health data in the (ECHP), first wave 1994 reveals that almost 6.9% of the European population (EU12) report being severely hampered in their daily activities 'by any chronic physical or mental health problem'. This means that an estimated 19.3 million Europeans (16 years of age and over) experience serious consequences of health problems. Another 16% feel hampered 'to some extent'.

Although some of these differences may be due to different interpretation of words like 'severely' and 'to some extent' in various languages and cultures, it seems plausible that real differences do exist. The sum of 'severely' and 'to some extent' hampered in daily activities appears to be less than 10% for the youngest age groups (16-34 years) and exceeds 60% among the elderly. The increase with age is stronger among women than men.

Nearly 13% of the European population (EU12) reported that 'during the two weeks ending yesterday' they had to cut down on the things usually done 'about the house, at work or in free time'. This figure combines the physical ('illness or injury') and mental ('emotional or mental health problem') reasons for 'cut down'. Looking at these two separately, 10.4 % of the population reported a cut down of activity because of 'illness

or injury', 1.3% because of 'an emotional or mental health problem' and 1.3% reported both reasons. These differences are probably due to age differences between men and women. There are relatively large differences between the Member States.

It should be noted that *temporary cut down of activities*, as defined in the (ECHP), is related to the season of the year and that the interviews did not take place in the same season in all countries. Approximately half of the countries started in spring and concluded September/October, the others carried out the survey during the last three months of 1994. The seasonal variations in Europe regarding the figures on 'temporary cut down of activities' are not known, although quarterly figures from national health surveys show that the 'spring-autumn' difference is practically zero (the summer-winter difference is about 3%).

Visually impaired people

Data from the European Blind Union (EBU) is based on national registers. The total of visually impaired people in 1994 in EU is estimated at 2.775 millions (764.9 per 100 000 of population). Comparisons between countries are difficult due to the different implementations of WHO definitions.

The WHO defines different categories of low vision according to visual acuity and visual field: *severe* (less than 0.1 → ≥ 0.05), *profound* (less than 0.05 → ≥ 0.02 and less than 20°), *near-total* (less than 0.02 → 1/∞ and less than 10°) and *total blindness* (visual acuity 0). Data from EBU is based on estimates provided by its member organisations.

Disability free-life expectancy

Data from the [ECHP], were used for this study carried out by INSERM / REVES (Réseau Esperance de Vie en Santé).

According to REVES, severe-disability-free life expectancy and disability-free life expectancy, taking all levels of disability together, vary significantly from one country to another within the EU. The only way of explaining these results, other than by an actual difference in rates of disability in daily life, is to consider whether the terms could have different meanings in the various countries and whether, therefore, they express differing types or degrees of disability. To counter this argument, REVES notes firstly that there is absolutely no geography of disability bringing together several countries on the basis of cultural criteria, such as the Scandinavian or Latin countries.

According to REVES, it is unlikely that differences in rates of institutionalisation, and in the severity of the levels of disability of the institutionalised population, explain the significant differences in disability-free life expectancy in the various Member States of the EU. Ideally, we would need to have comparable information on the levels of disability of the institutionalised population in the various institutions of the Member States. At European level REVES estimations indicate that the higher the life expectancy, the lower the proportion of severe-disability-free years. Disability-free years account for a lower proportion of total life expectancy for women. This is not so surprising since as a rule, living longer at high age is going hand in hand with growing restrictions in activity. One could say that Europeans live longer but that the years added to life imply more disability; a situation which is probably not the same in every Member State and which may change in time with changing health care and aids.

Disability free-life expectancy is calculated on the basis of mortality and disability data. The calculation of disability-free life expectancies was derived using the Sullivan method to estimate disability-free life expectancies. The *mortality* tables come from Eurostat. They are all for 1994, except for the Italian and Belgian tables, which cover 1993. *Disability data* are taken from the [ECHP] (1994 data). The ECHP contains various questions on health, including a general question on restrictions on the activities of daily living caused by a health problem. Given the lack of comparable data for people living in institutions, REVES has assumed that, in each country, they have disability rates comparable to those of people living in households. This hypothesis is unlikely but is leading at least to a minimum estimate. Another assumption would be to consider that all people living in institutions have a disability, which would lead to a maximum estimate. However the type of institution differs from country to country, and no sufficient data are available on severity of disability. Also, to be able to present calculations at birth, REVES has, for all countries and for both genders, applied a constant disability rate (of 1%) between the ages of 0 and 16. This rate, which is compatible with the values observed over the age of 16, has virtually no impact on the value of disability-free life expectancies. Finally, REVES has calculated confidence intervals, for people over the age of 16, by the Mathers method (1991), using Jagger's calculation table (1997).

People disabled for work

According to the 1997 Eurostat Labour Force Survey (LFS), 6.1 million Europeans (3.3 million men and 2.8 million women) declare themselves to be inactive due to a permanent disablement for work. That represents 1.5% of the total EU population according to the LFS. Certain EU Member States have high levels: Finland (4.0%) and Denmark (3.5%), but these percentages might be a result of the use of handicap social schemes as a measure for the reduction of unemployment figures. No detailed analysis on degrees of disablement, reasons for looking or not looking for a job and other factors regarding the situation of these persons is at present stage possible. A 'module' on disabled people will be integrated into the LFS in 2002, and this will increase knowledge about prevalence of disability, with special emphasis on the integration of disabled people into working.

The Community Labour Force Survey is a annual survey carried out on the basis of a revised set of concepts designed to guarantee an improved degree of comparability between the Member States and also, as far as possible, with other countries. The concepts and definitions used remain essentially those adopted by the thirteenth International Conference of Labour Statisticians of 1982. The methodological basis and the contents of the survey are described in the Eurostat publication *Labour Force Survey - Methods and Definitions - 1996 series*. In the LFS all persons who are not classified as employed or unemployed are defined as inactive. Apart from defining pupils and students separately, no further breakdown is provided for this group. The LFS asks about reasons for being an inactive person not looking for a job, one of them being permanent disablement. Conscripts on compulsory military or community service are excluded from the compilation of the survey results.

4. DIAGNOSTIC RELATED MORBIDITY

This section provides a brief overview on some disease groups. With the exception of cancer and some communicable diseases there are currently very few disease-specific data representing the whole EU population. Under the Community Action Programme on 'Health Monitoring in the Field of Public Health', a project was started to identify (national) sources for morbidity data in the EU. For the majority of communicable diseases, there is no reporting system, but for some diseases in some countries there is a legal requirement to report all cases.

Eurostat has begun to investigate some of the methodological issues involved. Different methods are used to collect incidence and prevalence data across countries. The possible effects of actual differences on the data must be taken into account when making comparisons between countries.

There are two basic types of morbidity statistics, measures of incidence and of prevalence. *Incidence* is a measure of the number of new cases arising in a population in a given period, and *prevalence* is a measure of the number of cases existing at a certain time. For example, incidence might be expressed as the number of new cases of a disease (or disorder) per 1000 population in a year, and prevalence as the proportion of a population with the disease at any time in a year. Incidence may refer either to the first onset of a disease (i.e. new cases) or to all episodes. For prevalence statistics from different studies to be comparable the length of period under consideration asked about must be the same. The main sources of disease-specific data for incidence and prevalence data across a range of EU countries are: *health interview surveys, cross-sectional population surveys, panel/cohort surveys, medical records/administrative statistics, hospital records, disease-specific registers, general practice (GP) records and administrative notifications.*

Cancer incidence and prevalence

Cancer is the second most frequent cause of death (the first is circulatory diseases) and is becoming the leading cause of death in old age. Most cancers arise in adults and at advanced age, and the risk increases sharply with age. Relative to other groups of diseases, the burden of cancer is, therefore, much more important in populations with a long life expectancy.

The data on incidence and prevalence for cancer refer to 1990 and 1995 and are provided by the International Agency for Research on Cancer (IARC)/WHO. Data on mortality are provided by Eurostat (see *Chapter V for details*). The IARC report that the estimated number of new cancer cases (excluding non-melanocytic skin cancers) in the EU in 1995 was about 1.5 million. According to Eurostat the number of cancer deaths in 1995 was 931 000. Both, incidence and mortality rates, were higher for men than women in all countries. The age standardised incidence rate per 100 000 of population for the all cancers groups is highest for men in France (300.5) and, for women, in Denmark (272.4). The lowest incidence rates for both sexes were found in Spain, Greece and Portugal. Men in France experienced cancer rates more than 50% higher than women; by comparison, in Denmark the excess in males was less than 1%. In 1995, lung cancer was the more frequent cancer for men, and for women the most frequent cancer was breast cancer. The 5 year prevalence rate reported by the IARC is 4.0 million cases, 2.0 million for men and 2.1 million for women.

For men and women in 1995, cancer of the lung (13.1% of total cancers), together with cancer of colon and the rectum, were the most common cancers. Lung cancer accounts for 29% of all cancer deaths for men in the EU, and 19.5% of all new cancer cases. The corresponding figures in women are 9.0% and 5.9% respectively. The higher incidence and mortality rates are largely due to their greater use of tobacco and alcohol, although there are other factors such as occupational and environmental exposures to carcinogens. Some 83% of the lung cancer cases in men and 34% in women are estimated, by IARC, to be due to smoking. Certain occupational exposures including asbestos, coal tars and arsenic, have also been associated with this cancer. In men, the increase of incidence rates appears to have stopped rising but in contrast, rapid increases in incidence rates in women are occurring in the south. Cancer of the colon and the rectum when combined are, next to lung cancer, the other commonly occurring cancers in the EU (13.3% over total). Incidence and mortality are high in the northern and western parts of the EU. There is little apparent variation in rates. The lowest rates are in the southern EU countries, that is, Italy Spain, Portugal, and Greece. Incidence rates have been stable or decreasing in all EC countries.

For cancer of the lip, oral cavity and pharynx, France, Spain and Luxembourg have the highest incidence among men. Incidence rates are much lower in women and do not vary greatly between countries. France is one of two countries of the world (the other is India) with a very high incidence (31.6) of these cancers in men. Incidence and mortality rates have generally increased among men except in France.

Incidence of laryngeal cancer has been increasing in recent times in southern EU countries to a level closer to that seen in the north. Incidence rates of laryngeal cancer in men are approximately 30% to 60% higher than mortality rates. Overall, the highest rates of this cancer are in males in southern EU countries. Trends in male rates have been variable, with large decreases in France and Luxembourg. Trends have not been examined in women because there are very few cases.

For cancer of the oesophagus, the incidence and mortality rates among men in France were about double or more those in other EU countries except the UK and Ireland. In contrast, rates among women were low in France. In the UK and Ireland, women had rates that were four times greater than the low rates in Spain and Italy. Greece had by far the lowest rates in both sexes. For cancer of the stomach, the rates for males are about double those in females. There is quite a wide range of rates for cancer of the stomach within the EU, with rates in the southern countries double or more those in the northern countries. The geographic pattern is similar in the two sexes. Stomach cancer in both sexes has been decreasing at more than 5% annually for the last 25 years.

The incidence and mortality of liver cancer are highest in the three southernmost EU countries. The variation in rates is considerable: the incidence in the south is six times greater than in the north among males and five times greater among females. The apparently higher rate of mortality than incidence is the result of recording deaths with metastatic liver disease as due to liver cancer. Liver cancer is uncommon in western European countries compared with the very high rates in Africa and Asia. The incidence and mortality of cancer of the pancreas are high in the north and lower in Greece, Portugal and Spain. The geographic pattern is similar in males and females. Cancer of the pancreas is almost uniformly fatal. In the EU countries the incidence of pancreas cancer is generally much lower than that of stomach cancer but the case-fatality rate is higher. Bladder cancer is between three and five times more common in men than in women. The highest rates are observed in Italy and Denmark. Incidence trends in bladder cancer are difficult to interpret because of the difference between cancer registers in recording benign and non-invasive tumours. There is considerable variation in the incidence and mortality of kidney cancer in the EU countries, with two to threefold differences in both sexes between low rates in Portugal and high rates in Germany and Denmark. In general, the highest rates are in the northern EU countries. These patterns are the same in males and females. Cigarette smoking is considered as the major risk factor and may account for between 17% and 45% of kidney cancer.

The incidence of melanoma is higher in the northern EU countries than the southern, with countries such as Denmark recording up to four times as many cases among men and five times as many among women than Spain, Italy and Portugal. While mortality rates are much lower than incidence rates, a similar strong north-south gradient is seen in both incidence and mortality for both sexes. Incidences of melanoma have increased steeply by about 7% annually in most EU countries.

Breast cancer is the most common cancer in females in the EU and represents 19.0% of cancer deaths and 28.5% of all new female cancer cases. Incidence and mortality rates are higher in northern EU countries than in the southern countries, both being nearly twice as high in the north. Incidence rates have increased in all EU countries, while mortality rates have started to decrease recently in younger women in Denmark, the Netherlands and the UK. Cervical cancer is the only cancer of women which does not show a clear north-south geographical gradient. In the EU, the incidence is highest in Denmark, while mortality is also high in the UK, Portugal and Germany. The incidence rates are lowest (almost half) in Spain Greece,

Luxembourg and the Netherlands. The overall decrease is partly attributable to the success of screening programmes. Cancers of the body of the uterus are mainly endometrial cancers. The low incidence and mortality rates in the southernmost EU countries resemble the pattern of breast cancer incidence and mortality rates. Incidences in Europe are considerably lower than in the USA, while mortality rates are higher (except in Greece). Rates of ovarian cancer are higher in northern than in southern EU countries, and resemble the pattern of breast cancer, with high incidence and mortality rates in the UK and Ireland. There is quite a large variation between countries with, for example, incidence rates in Denmark are twice that in Greece and mortality rates in Denmark some three times higher.

Prostate cancer accounted for an estimated 14.2% of all new male cancer cases in 1995 in the EU and 10.0% of all cancer deaths. It is the second most frequent cancer for men. Incidence and mortality rates are higher in the northern than in the southern EU countries. Incidence rates of this cancer have been increasing in all EU countries, although these rates may reflect the introduction of new diagnostic practices. Testicular cancers are relatively uncommon. The incidence of this cancer is highest in Denmark and other northern countries, with increases in all EU countries except Austria and Belgium.

There is little variation in the rates of non-Hodgkin lymphoma among the EU countries. Incidence and mortality rates vary by no more than about 25% from north to south, and the rates are about 40% to 50% lower in females than in males. Viral infections may account for a proportion of cases, and the AIDS virus increases the risk. Incidence rates have increased steeply and mortality rates less steeply in both sexes in all EU countries over the last 25 years. Hodgkin's disease shows no marked variation in incidence rates within the EU. The rates are slightly higher for males than for females. The international variation in incidence rates of this disease suggests that, as with non-Hodgkin lymphoma, environmental factors may have an effect. Incidences have remained stable in the EU, while mortality rates have declined, although less markedly in Belgium and Ireland than elsewhere. Leukaemia in the EU countries shows incidence rates 60% higher in males than in females, but there is little geographic variation. Incidence rates have been mainly stable, although increases in both sexes have occurred in the Netherlands and Ireland.

Data on cancer are collected by the European Network of Cancer Registries and the (IARC)/WHO with the support of the EU's past and present action programmes on cancer. 29 centres in Europe have reported the information on the incidence on cancer for 1990 and 1995. The data recorded are usually checked for internal coherence by expert cancer registry staff at the point of registration. The incidence is the number of new cancer cases arising in a given period in a specified population. This information is collected routinely by cancer registries. The prevalence of cancer is the number of cancer cases in a given population at a specified point in time. It depends on the incidence and on the duration of the disease, that is, on survival. An age-standardized rate (ASR) is a summary measure of a rate that a population would have if it had a standard age structure. Standardization is necessary when comparing several populations that differ with respect to age because age has such a powerful influence on the risk of cancer. The most frequently used standard population are the World and the European standard populations. The calculated incidence or mortality rate used here is the World Standardized incidence or mortality rate. It is also expressed per 100 000 population.

Cancer survival rates

In all countries participating in the EUROCARE II study, life expectancy at birth is higher for women than men (*see Chapter I*). Differences in life expectancy between the sexes are inversely associated with the relative risk of dying (women as against men) for all cancers combined (*correlation index: $r = -0.7$*). The age-standardised 5-year relative survival by gender for cancer patients of 15 years age and over, in the period

1985-1989, showed that the risk of dying was very high in diagnosis of pancreas, liver and oesophageal cancer. And that it was similar for men and women for several common malignancies (e.g.: colon, rectum, pancreas, lung and leukaemia). Whilst the risk was slightly smaller for women with, for example, stomach, larynx and kidney cancer and non-Hodgkin's lymphomas. For melanoma of the skin and thyroid the risk for women was definitely lower, whilst for bladder and small intestine, the risk was higher in women. For cancers of the upper respiratory tract women had a lower risk of dying. Differences by country can be significant, the five year survival rate for all neoplasms for the European countries participating in the study being 42% for men and 53% for women. Switzerland (51%), and Sweden (50%), had the best rates for men and Switzerland (62%), France (59%) and Germany (59%), for women.

The EUROCARE II (Cancer registries based study on survival and care of cancer) project, supported by the European Commission, was carried out on 1 188 469 cancer adult patients (ICD9: 140-208 except 173) diagnosed from 1985 to 1989 in 17 European populations. Cases discovered at autopsy, first diagnosed with another malignant tumour or known on the basis of death certificates were not included. Cases were followed for a minimum of 5 years after diagnosis. Some registries (DK, FI and ISL) cover the population of the entire country, whereas the rest are represented by a number of local and regional registries.

AIDS

Another public health area in which the EU is active is the area of communicable diseases, especially AIDS. Specific programmes against AIDS have been launched since 1991. In 1998, 12 367 new AIDS cases (adjusted for reporting delays) were reported from the EU countries to the European Centre for the Epidemiological Monitoring of AIDS in Paris (supported by the European Commission), bringing the cumulative total in EU since 1983 to 207 933 cases. For the third consecutive year since the start of the epidemic, the annual number of new reported cases decreased (by 23% between 1997 and 1998). Annual AIDS incidence per million (adjusted for reporting delays) was estimated at 24.8 in 1998 having decreased by more than 18% in 1996/98 in the WHO European Region after reaching a plateau in 1994 (48.2) and 1995 (47.5).

For age groups 25-29 and 30-34, new AIDS cases in the EU represent 20.4% and 27.2% respectively. The distribution by age groups is very similar in EU countries with some exceptions in the 15-24 group for which Portugal (12.5%) is twice the EU average (5.8%) and in the 50-59 age group, for which Luxembourg (13.9%) and Germany (13.0%) are also twice the EU average (6.8%).

Comparing 1998 with 1997, and 1997 with 1996, the largest decrease of AIDS cases is estimated for homo/bisexual men (-23% and -37%), followed by injecting drug users (IDU) (-28% and -31%) and heterosexually infected persons. (-10% and -19%). For men, IDUs continue to account for the highest proportion of cases diagnosed each year (40.1% of adult/adolescent cases in 1998), followed by homo/bisexual men (34.5%) and heterosexually infected persons (15.4%).

Women account for 20.9% of adult/adolescent cases diagnosed in 1998, compared with 11% in 1986. Of these women, 47.5% had been heterosexually infected, often by an IDU sex partner (27% of heterosexually infected women). The number of paediatric AIDS cases infected through mother-to-child transmission continued to decline, from 286 cases in 1995 to 88 cases in 1998.

Similar patterns of the levelling off of new cases in 1996, 1997 and 1998 are apparent in most Member States. Slight increases were observed in 1998 in Belgium (+25%) and Austria (+17%) and a stable situation in Germany but all these countries were in regular decrease since 1991. Significant decreases are observed

in Spain (-20%), which nevertheless remains the EU country with the most significant incidence, in Italy (-30%) which has for a long time been the EU country with the second-highest incidence and, weakly, in Portugal (-2%) where the AIDS incidence has increased rapidly over the last few years due to a recent epidemic among IDUs.

While the decreasing trends in AIDS incidence in the EU could be partly explained by a peak in HIV incidence in Western Europe in the mid-1980s. The size and abrupt nature of the decreases and, in particular, the unexpected decrease in the category of heterosexual transmission (for which there are no data to suggest that HIV incidence has peaked), suggest that other factors should also be considered. Trends in AIDS incidence were affected by the progressive implementation of the 1993 revision of the European case definition, which resulted in an unusually large increase in 1994 followed by a relative decrease in 1995. However, trends since 1995 should be affected only minimally. The recent declines in AIDS incidence result from the increasing use of highly active antiretroviral treatment (HAART) since 1996 and the patterns of past HIV incidence which peaked in the mid 1980s. The current decline in AIDS incidence does not mean, however, that HIV incidence is currently declining; in the medium term HIV prevalence will probably increase.

A European HIV reporting system is currently being set up, which should allow better monitoring of HIV epidemic trends in the changing situation characterised by the advent of HAART and by emerging epidemics in some parts of Europe. In previous years, a systematic HIV antibody screening of blood donations was instituted in EU countries. While blood donors are (or should be) clearly a selected population at low risk for HIV infection and hence are not representative of the population at large, HIV prevalence in blood donations provide some indication of the spread of HIV in general population.

In 1999, a reporting system of HIV took place in 15 of the 18 Member States of the European Economic Area (EEA) at national or regional level. Thirteen countries began to report before 1991 and two (Greece and Luxembourg) in 1999. Cases of HIV infection are reported by laboratories in four countries, by clinicians in two and by both in ten countries. A cumulative total of 100 157 HIV cases in EU (only for 11 Member States) were reported in 1998. For these 11 countries, a total of 7 241 HIV cases and 3 938 AIDS cases were reported in 1998. All countries reported more cases of HIV than AIDS with ratios ranging from 1.5 in Switzerland to 4.5 in Belgium, 4.0 in Iceland and Finland and 3.9 in Sweden. In the countries accounting for two thirds of reported AIDS cases (Spain, Italy, France and Portugal) the HIV reporting system has yet to be implemented or has only just started in some regions. Reporting of HIV infection must be interpreted with caution, because these reports do not provide an accurate measurement of the incidence and prevalence of HIV infection. The proportion of HIV infected individuals who are diagnosed and reported varies according to the phase of the epidemic, HIV testing patterns and characteristics of surveillance systems. Annual numbers of HIV infections reported in the 90s were relatively stable in some countries and decreased in others. The comparison of HIV and AIDS reporting data suggests that the level of HIV transmission has remained relatively stable in recent years and that the sudden decline of AIDS incidence has been due mainly to the effect of HAART.

The HIV/AIDS pandemic is primarily caused by HIV-1. Another type of virus, HIV-2, is found mainly in certain West African countries. In Europe most of the cases of HIV-2 infection described have been in people from Africa. National results exist from screening blood donations and seroprevalence surveys of pregnant women, people attending sexually transmitted diseases (STD) clinics and other selected populations such as IDUs. Of the 35 156 852 blood donations tested in 17 countries, 855 were positive for HIV-1 and only 6 for HIV-2, the prevalence of HIV-2 in blood donations being less than 0.3 per 100 000. The same results are found in AIDS cases. Only 1.8% of total cases are due to HIV-2. These confirm that HIV-2 is relatively rare in Europe.

Because of reporting delays (time between diagnosis of an AIDS case and reporting to national level), the European Centre for the Epidemiological Monitoring of AIDS in Paris (supported by the European Commission) suggests that the incidence trends are best assessed by examining data by year of diagnosis, with adjustment for reporting delay, rather than by year of report. Reporting delays varies widely between countries and transmission groups, and may be as long as several years in some cases. Overall, approximately one-third of the cases are reported by the end of the quarter within which they were diagnosed, and between 10% and 15% are reported more than one year after diagnosis. The countries participating in the surveillance of AIDS in Europe use a uniform AIDS case definition definitively adopted in 1993. The European definition differs from the definition used in the USA in that it does not include CD4 lymphocyte-count criteria.

The characteristics of national HIV reporting were explored in a preliminary survey in 1997 and updated in 1999. Individual anonymous data (or, if not possible, aggregated data) on HIV infections diagnosed at any clinical stage and reported by the end of 1998 were collected from national HIV/AIDS surveillance institutes taking part in European AIDS reporting.

Tuberculosis

The current epidemiological situation for tuberculosis (TB) has been strongly influenced by the onset of the HIV epidemic among young adults with co-infection by HIV and the *Mycobacterium tuberculosis*. In most EU Member States the number of cases has significantly decreased until 1975. In the late 80s and early 90s, an increase in tuberculosis case notifications was observed in several European countries. In the same period, several epidemics of multi-drug resistant TB were reported in the USA and a few in Europe, causing much international concern. Several initiatives were undertaken at European level to assess the changing epidemiological situation of TB, but were limited by differences in definitions and in the quality of TB surveillance systems between countries. In 1997, 50 907 new cases of tuberculosis were notified in EU. Data on the incidence per 100 000 population of tuberculosis are collected by the EuroTB network, and show that TB remains a major health problem in Portugal (51.4 cases per 100 000 inhabitants in 1997). The EU average remains at 13.7 despite a significant decrease since 1970. The data by sex for 1996 shows a proportion of 61% of men and 39% of women. The vast majority of the cases were new episodes of TB in persons never diagnosed previously. It is known that countries with a low incidence of TB report proportionally more cases in older age groups, mainly due to reactivation of former *Mycobacterium tuberculosis* infection.

The EuroTB programme for the surveillance of tuberculosis in Europe was set up in 1996 to collect, analyse and disseminate data on tuberculosis cases notified in the (WHO) European Region. The programme is managed jointly by the European Centre for the Epidemiological Monitoring of AIDS (CESES) in Saint-Maurice (F) and the Royal Netherlands Tuberculosis Association (KNCV) in The Hague (NL), and is financially supported by the European Commission. The principles and methods are those recommended by a working group set up by the WHO and the International Union against Tuberculosis and Lung Disease (IUATLD). Rates of incidence are calculated per 100 000 of population using a standard world population. Notification rates may not fully reflect true tuberculosis incidence rates due to underreporting and other problems. Figures may slightly differ from those published by WHO because WHO figures are collected several months prior to those collected by EuroTB, and as such, are often provisional.

Diseases preventable by immunisation

Most EU countries have immunisation programmes against diphtheria, tetanus, pertussis, poliomyelitis, measles, rubella and mumps (see also point *Immunisation coverage in the EU*). Hepatitis B immunisation is obligatory only in 10 EU countries. Diseases such as malaria, pneumococcal pneumonia, meningococcal meningitis and influenza can be covered by voluntary vaccinations.

According to WHO data, the current epidemiological situation as regards the incidence of hepatitis B is influenced by the onset of the HIV epidemic among adults with co-infection from HIV and hepatitis B, and by massive and sometimes polemic vaccinations especially since 1994. An increase in incidence of hepatitis B was observed between 1992-95 in Portugal, values have since decreased sharply. In the remaining EU members (EU average is 4.1 in 1997) incidence is decreasing but the disease has not been eradicated.

According to WHO data, the incidence of pertussis is slowly increasing in the EU, from 18.3 in 1990 to 43.3 in 1997. New boosters of the vaccine are currently being implemented. For 1997 highest values are found in Sweden (28.2), the Netherlands (22.4) and Norway (41.7). Several cases of diphtheria were imported from the former USSR (35 631 cases were registered in Russia in 1995) into neighbouring countries such as Finland (8 cases in 1993/95) and Germany (19 cases in 1993/95), but no secondary cases have yet been observed around the few imported cases. The rest of the EU Member States reported zero or a rare single case in recent years. The countries of the EU reported no incidence of poliomyelitis after 1989 until a risk of an outbreak occurred after the virus was imported into the Netherlands in 1992-93 (polio continues to be endemic in Turkey and the countries of the former USSR).

The incidence of neonatal tetanus is practically zero everywhere in the EU and can also be considered as eradicated. Other cases of tetanus were mainly recorded in Italy, France, Spain and Portugal. The remaining EU Member States reported up to 4 cases per year after 1982.

The incidence of measles is strongly decreasing, but outbreaks appeared in Belgium in 1996 and in Greece and Italy in 1995. The incidence of rubella is also decreasing after the last period of high incidence in 1983/84. The EU rate fell from 223.9 in 1983 to 20.0 in 1997. All the EU countries showed larger reductions after 1983 even if isolated increases were detected in 1996 in Spain and Iceland. In Germany, Denmark, Sweden, France and the Netherlands negligible incidences are observed. The incidence of mumps is strongly decreasing in the EU, from 260.2 in 1985 to 36.9 in 1997. Only Portugal (195.2), France (68.3), Belgium (58.0) and Italy (51.6) have higher incidence rates.

An infectious viral disease that still causes mass sickness, and excess mortality among the elderly, is influenza. Based on reports from National Influenza Centres to WHO (FLU NET network) and according to maps, the clinical consultations for influenza syndromes or acute respiratory infections in the winter season 1998/99 have not experienced substantial morbidity. For 1999/2000, the number of viruses isolated are gradually increasing and in an increasing number of countries reaching everywhere a situation of widespread outbreak. The first sign of epidemic activity in 1999/2000 in Europe was during the first week of December 1999, in south of France. Influenza activity intensified to widespread or regional level from the second week of December up to the second week of January in Belgium, Finland, France, Germany, Iceland, Ireland, Italy, Netherlands, Norway, Spain, Sweden, Switzerland and UK. Almost all viruses isolated were influenza A, some were identified as subtype A(H3N2). According to Eurostat the number of deaths due to influenza in EU has increased during the last available 3 years from 2 532 in 1994 to 3 420 in 1995 and 4 323 in 1996.

Sexually transmitted diseases

Sexually transmitted diseases (STD) include the diseases classically referred to as venereal diseases (*syphilis, gonorrhoea, chancroid, lymphogranuloma venereum, inguinal granuloma*) and other caused by a variety of agents, such as bacteria, viruses, fungi, protozoa and arthropods, the most recent being infection by the HIV/AIDS (*see point AIDS*). According to WHO data the STDs with statutory notifications (syphilis and gonorrhoea) have decreased steadily over the past 20 years. Incidence of syphilis, which some years ago was a great threat, has decreased significantly, and in 1997 the EU rate was only 1.5 (5.6. in 1985). Incidence in Finland, Austria and Portugal remains stable.

The level of gonococcal infections has decreased from 56.8 per 100 000 in 1980 to 7.6 in 1997, peaking in 1986 at 60.2. Genital warts, genital herpes and chlamydial infections appear to be as common now as syphilis or gonorrhoea some years ago, but no comparable statistics are available. Data from Eurosurveillance, (information network on communicable diseases supported by the European Commission), for certain EU members seems to confirm this trend. In Italy for the period 1991-1996 the most diagnosed STD were: genital warts (29.4% of STD cases), non-specific vaginitis (18.0%), non-specific urethritis (12.3%), genital herpes (7.7%) and Chlamydial urethritis (4.6%). Some data available for France and the UK seems to confirm similar trends. However, recent information from Eurosurveillance for 1997/1998 suggests a sudden increase of gonorrhoea in France (1998) and England (1997).

Other communicable diseases

The incidence of malaria varies widely between EU countries, mainly as a result of people contracting the disease in malaria endemic regions. The EU incidence increased slowly from 0.6 per 100 000 in 1974 to 1.0 in 1984, 2.0 in 1992 and 2.9 in 1997. The incidence increase ranges from 0.1 in Greece to 9.2 in France.

There is no vaccine against hepatitis C (HCV). Research is in progress but the high mutability of hepatitis C genome complicates its development. WHO has recently published the first global estimate of HCV prevalence, which suggests that, up to 1.5% of the Greek population has been infected with HCV; prevalence in France and Belgium are respectively 1.2% and 0.9%. However, according to the specific subgroups of the population such as drug users, prevalence may be as high as 70.0% (in these groups).

A very particular case of communicable disease is the Creutzfeld-Jacob disease (CJD) related to the development of BSE (175 975 animal cases in EU at 5.11.1998) in the EU. A certain number of Member States classify CJD as a notifiable disease but there is no consensus on the definition of this disease among the Member States. According to the data provided by the European Commission, the trend in the number of cases referred to the diagnostic centre for CJD ascertainment in the first six months of 1997 is similar to that described in the previous years. The data must be interpreted with caution, as there is a long delay between the onset of the disease and the diagnosis by a specialised centre. It should also be noted that data from the UK are based on deaths, whereas those of the other Member States are based on cases. 60% of these cases are recorded as "definite" for 1995 and 1996, but there are important variations between Member States (Austria and UK have nearly all cases as "definite" while this represents only half of the cases in Italy). Sometimes there are variations within one Member State (for example "definite" cases represent in France 49% and 71% respectively of total cases in 1995 and 1996 as they represent 63% and 23% in the Netherlands for the same years). For the first six months of 1997, 50% of the cases are recorded as definite, probably due to the long process between suspicion and ascertainment. But these figures reflect also different processes for notification, as in Ireland, Finland and Greece, 100% of cases are definite while in Spain only 20% are definite in the same period.

Congenital anomalies

The EUROCAT (European Registration of Congenital Anomalies) project, established with support from the European Commission, is a surveillance system based on a network of regional registries having covered a total of 3 948 324 births in the period 1980-1994 in EUR12 and 3 non Member States (Malta, Croatia and Switzerland). The ascertainment of congenital anomalies and the precise diagnoses are based on the use of active case-finding and of multiple sources of information such as birth and death certificates, maternity and hospital records, including specialised departments for diagnosis (radiography) and treatment reports from laboratories (cytogenetic, biochemistry), pathology services, maternal and child health services, etc.

A total of 71 480 babies/foetuses registered (representing 2.4% of the total in the period surveyed) were affected by a major congenital anomaly in the centres following the EUROCAT methodology. The total prevalence based on the 16 selected centres is 235.6 per 10 000 births, with considerable variations between registries from 326.1 in Strasbourg to 153.4 in Belfast. Induced abortions represent an increasing part of the sample (24.5), with local rates varying from 48.7 in Paris to only 7.9 in Belfast.

The most frequent anomalies according to the system or group of anomaly are limb defects (prevalence of 56.1 defects per 10 000 live and still births, representing 24.9% of total cases) and congenital heart diseases (prevalence of 54.3, representing 22.7% of total cases). The prevalence and percentage of cases are lower for the rest of the groups: musculoskeletal anomalies (28.7 and 12.4%), nervous system (26.7 and 11.9%), chromosomal anomalies (25.9 and 10.2%), anomalies of the internal urogenital system (26.1 and 9.7%) or anomalies of the external genital organs (16.5 and 6.1%).

Within the chromosomal anomalies the overall prevalence of Down Syndrome at birth is amongst the highest (16.1). Overall rates by centre range from 2.3 in Galway (UK) to 1.1 in Antwerp (Belgium). These differences could be partly explained by different maternal age distributions and by registration or not of induced abortion where legal. Among younger age groups, there is no evidence for a difference between registries.

The proportion of pre-natally-diagnosed cases (PND) in anencephaly increased from 81.0 % for the years 80-85 to 97.9% in 1991-92. Down Syndrome was PND in 42.3% of cases in 1991-92 (15.0% for 1980-85), varying from 10.4% in Belfast to 67.5% in Paris. For mothers of 35 years of age or more, 73.5% to 84.2% were PND in the French registries over the same period.

EUROCAT registries, co-ordinated by a Central Registry since the end of 1992 at the Scientific Institute of Public Health - Louis Pasteur in Brussels, aim to cover all foetal deaths from 20 weeks' gestation. This low limit eliminates any artificial distinction between live births and stillbirths of low gestational age. This is especially important for malformed babies considered not to be viable (such as those with anencephaly), since whether they are considered live born or stillborn may be influenced by medical customs or social or welfare considerations. However, foetal deaths of low gestational age (20 to 27 weeks) will not be found in birth statistics, leading to a slight discrepancy between numerator and denominator in calculations of prevalence.

Cardiovascular diseases

Circulatory diseases are the main cause of mortality in EU countries. More than 1 350 000 Europeans died from circulatory diseases in 1992, and thousands of others remained disabled by them. Diseases of the heart and circulation are for most people the greatest risks to life. While data are available on mortality, good

data on morbidity are currently lacking. The MONICA (Multinational monitoring of trends and determinants in cardiovascular disease) project was established by the WHO in the early 1980s in many centres around the world. The objectives of the MONICA Project are to measure the trends in cardiovascular mortality, coronary heart disease (CHD), cerebrovascular disease morbidity and to assess the extent to which these trends are related to changes in known risk factors, daily living habits, health care, and major socio-economic features measured at the same time in defined communities in different countries.

During 371 population-years, 166 000 events were registered. Official CHD mortality rates, based on death certification, fell (annual changes: men -4.0%; women -4.0%). By MONICA criteria, CHD mortality rates were higher, but fell less (-2.7% and -2.1%). Changes in non-fatal rates were smaller (-2.1%, and -0.8%). MONICA coronary-event rates (fatal and non-fatal combined) fell more (-2.1% and -1.4) than case fatality (-0.6% and -0.8%). Contribution to changing CHD mortality varied, but in populations in which mortality decreased, coronary-event rates contributed two-thirds and case fatality one-third. Over the decade studied, the 37 populations in the WHO MONICA Project showed substantial contributions from changes in survival.

The EU-MONICA registers, based on 170 000 people studied from the mid 1980s to the mid 1990s the average rates of heart disease for men and women. The highest rates for men are found in participating regions within the UK and within Finland. The highest rates for women are in the UK. The lowest average heart attack rates for men are in areas in Spain, Switzerland and France, and for women the highest rates are in areas of Spain, France and Italy.

The greatest fall in coronary event rates in men occurred in 3 participating regions, 2 in Finland and 1 in Sweden. With the exception of Catalonia (Spain), male populations experiencing a notable increase in rates were predominantly from Central and Eastern Europe and Asia. In women, the populations experiencing significant increases again tended to be from Central and Eastern Europe and Asia, but the general pattern of increases and decreases appeared to be less consistent. Where mortality rates were falling, change in survival contributed one-third and change in heart attack rates two-thirds, on average, of the total change in survival rates, indicating the importance of both the prevention of heart disease and improved care of acute events.

MONICA is a project established by the WHO to provide a cross-sectional and longitudinal comparison of cardiovascular disease (coronary heart disease event registration is obligatory, stroke optional), and to relate these to risk factor changes in the population over a ten year period. This monitors trends over 10 years, across 37 populations in 21 countries. It was set up to explain the diverse trends in cardiovascular disease mortality, which were observed from the 1970s onwards. The total population aged 25-64 years being monitored is 10 million men and women. Registers identify non-fatal definite myocardial infarction and definite, possible, or unclassifiable coronary deaths in men and women aged 35-64 years, followed up for 28 days in or out of hospital. MONICA calculates rates from population denominators to estimate trends in age-standardised rates and case fatality (percentage of 28-day fatalities = [100-survival percentage]).

Diabetes mellitus

Diabetes mellitus is a chronic disease caused by inherited and/or acquired deficiency in the production of insulin by the pancreas. Twenty years ago, diabetes was considered an uncommon disease, but today it is an important health problem. World-wide incidence is expected to increase as a result of ageing population, unhealthy diets, obesity and sedentary lifestyle. Because of its chronic nature, the severity of complications and the means required for control, diabetes is a particularly costly disease for the health care services and

for the individuals affected. According to the estimates provided by the International Diabetes Institute, the estimated prevalence of diabetes mellitus in 1994 was 3.4% over total population for EU (without Greece). National values are generally close to the average, ranging from Italy (5.0%), to Ireland (2.1%). According to the projections for the EU the number of cases for the period 1994/2000 could increase by 22.5% and a further 18.3% in 2010.

The information presented here comes from the International Diabetes Institute (WHO collaborating centre for diabetes). Diabetes estimations for 1994 were generated using age-specific diabetes prevalence rates from different sources and applied to the underlying 1994 demographic age-distribution for every country to generate the diabetes estimates. When diabetes prevalence data were not available for a country, data from nearby country with a similar ethnic composition were used as a substitute. The estimate includes IDDM (insulin dependent diabetes mellitus) and NIDDM (non-insulin dependent diabetes mellitus). Since IDDM prevalence has a marked geographic distribution, 7 to 20% of the adult diabetes cases were presumed to be IDDM depending on the latitude of the country. The remainder cases were presumed to be NIDDM. The projections for 2000 and 2010 were calculated by first examining all the NIDDM prevalence rates available for some groups, then selecting the most appropriate higher rate, and finally applying this rate to the 2010 projected demographic age-distribution.

Occupational diseases

These results constitute the initial findings of a pilot project from Eurostat on European Occupational Diseases Statistics (EODS-project). Eurostat at the request of the European Commission compiled European Statistics for 1995 with respect to 31 items selected from the European Schedule of Occupational Diseases (90/326/EEC). Most of the occupational diseases corresponding to the selected 31 items were covered in all Member States.

Comparisons between Member States should be made with caution, whereas analysis between industries is more appropriate. In 1995, the total number of cases of occupational diseases, with respect to the 31 items chosen from the European Schedule of Occupational Diseases, was 57 414 recognised cases which represents a incidence per million of occupational diseases from 386.9 for EU. These statistics thus cover 70% of all recognised cases of occupational diseases in Europe in 1995.

Hearing disorders (with an incidence of 124.1) thus make up about one-quarter of the sub-set of data covered by Eurostat. More than 90% of cases of hearing disorders contracted at work are in men. Important factors are that the participation rate of men in the labour market is higher than that of women, and men more often carry out tasks that involve, for example, noisy machinery and tools. Most cases of skin ailments are recorded in the manufacturing and social sector (hospitals). The latter sector represents most cases of infectious diseases, which are acknowledged as occupational-related for persons working in hospitals and the like in most of the recognition systems.

A total of 6 698 cases of respiratory diseases are due to exposure to asbestos. These cases are mainly reported from manufacturing and construction. In these sectors asbestos fibres are processed and used for various purposes, e.g., asbestos cement, vehicle brakes, etc. Most recorded cases of occupational cancer are due to exposure to asbestos. Underground working is the main source of occupational exposure to dust containing silicon dioxide causing silicosis. This applies also to pneumoconiosis caused by silicate dust, and most cases are consequently reported from the mining sector. Respiratory ailments of an allergic nature make up the biggest group of recognised cases for the agricultural sector. However, most cases are reported from the manufacturing sector due to its size.

'Hand-arm' vibration syndrome', comprising osteoarticular diseases of the hands and wrists and angioneurotic diseases, are due to mechanical vibrations from tools or objects transmitting vibrations. Most of the 5 266 recognised cases are reported from the manufacturing, mining and construction sectors, which involve work with powered tools and machines. The 3 069 cases of paralysis of the nerves due to pressure cover are mainly cases of 'carpal tunnel syndrome'. Repetitive hand-arm movements mainly cause the latter, and France reported most of the cases. Diseases of the periarticular sacs are due to work that involves a prolonged pressure on either the elbow or the knee. Such types of exposure will be seen in particular in the building and construction sector, which involves kneeling or other work postures, where pressure is placed on either the elbow or the knee. The figures show that most cases were reported from the building and construction sector.

EODS includes cases recognised by the Member States using their national criteria for the establishment of a disease as work-related. The first publication includes only cases which are in accordance with the sub-set of 31 items selected from the European Schedule of occupational diseases listed here: *Diseases caused by the following chemical agents* (Isocyanates, Cadmium or compounds thereof, Chromium or compounds thereof, Mercury or compounds thereof, Manganese or compounds thereof, Nickel or compounds thereof, Lead or compounds thereof, Carbon disulphide, Benzene or counterparts thereof, Halogenated derivatives of the aromatic hydrocarbons, *Skin diseases caused by substances and agents not included under other headings* (Occupational skin diseases caused by by-products of the distillation of coal, Occupational skin ailments caused by scientifically recognised allergy-provoking or irritative substances not included under other headings), *Diseases caused by the inhalation of substances and agents not included under other headings* (Silicosis, Asbestosis, Mesothelioma, Pneumoconiosis, Bronchial cancers (asbestosis), Broncho-pulmonary ailments caused by dust from sintered metals, Respiratory ailments (allergies), Respiratory ailments [Co, Sn, Ba, Graphite], *Infectious and parasitic diseases* (Infections or parasitic diseases transmitted by animals, Brucellosis, Viral Hepatitis, Tuberculosis), *Diseases caused by the following physical agents* (Cataracts caused by heat radiation, Hypoacusis or deafness caused by noise, Osteoarticular diseases of the hand and wrists caused by mechanical vibration, Angioneurotic diseases caused by mechanical vibration, Diseases of the periarticular sacs due to pressure, Paralysis of the nerves due to pressure, Diseases caused by ionising radiation).

Musculoskeletal diseases: osteoporosis

Musculoskeletal diseases or chronic rheumatic diseases include about 200 conditions affecting joints, bones, soft tissues and muscles. They amount to a huge burden in pain and often crippling disability and consequently, high costs in terms of health care and loss of productivity. These diseases claim the most sick days, the most long-term sick leave and the most disability pensions.

Some comparable data are, at present, available only for osteoporosis. Results from a report supported by the European Commission, based on different national studies, show the incidence per 10 000 of hip fractures is increasing in most Member States and it is presumed that this trend will be stronger in future years. Total rates are higher for women from 89.0 per 10 000 women in Germany and 55.0 in the UK. Comparisons must be made with caution taking account of diversity of sources used in the study.

Data for musculoskeletal diseases comes from two types of sources: surveys and administrative data. For hip fractures data comes from the MEDOS study (Eilfors et al. 1994) with weighting according to

size of sectors and stratification by age groups. The study considers that incidence increase exponentially with age and the data has been converted to natural logarithms in the middle point of every age class and after using a linear regression. For vertebrae fractures, results of the EVOS (O'Neill 1996) study has been used estimating prevalence by use of two radiological standardised methods.

Mental disorders

Mental disorders are an important public health consideration because of their prevalence, severity and economic and social implications. According to different national studies, there appears to be a stabilisation of schizophrenia, maniac-depressive illness, paranoia and an increase of dementia and disorders related to pathological responses to social circumstances (depression, anxiety and disturbed sleep, alcohol and/or psychoactive drug dependence). No comparable data on incidence or prevalence of specific mental diseases (with and without hospitalisation) are available.

The European Network on Mental Health Policy (ENMHP), which is leading a European project, supported by the European Commission, to improve knowledge on mental health indicators, estimates that the prevalence of mental disorders could be around 9.0% of total population in the self reported and 17.0% in the clinically diagnosed.

Neurodegenerative diseases of old age

Population based studies of incidence and prevalence carried out in the EU (i.e. EURODEM) including elderly persons and also those living in institutions, can be useful to establish the trends in the prevalence of neurodegenerative diseases according to age and sex. Among older persons the most common neurodegenerative diseases are dementia and Parkinson's disease.

There are two major subtypes of dementia: vascular dementia (when it can be attributed to large or small strokes in the brain) and Alzheimer's disease (when no cause of dementia can be identified). According to the EURODEM results, most cases (70 %) of dementia are diagnosed as Alzheimer's disease. The age-specific prevalence of dementia increases with age and, after the age of 80, the number of women with dementia, particularly with Alzheimer's disease, is higher than the number of men with dementia.

For Parkinson's disease (PD) the prevalence as estimated by EURODEM ranges from 6 per 1 000 at age 65 to 30 per 1 000 at age 85 years and over; above the age of 75 the prevalence is estimated to be higher in men than in women.

Within the framework of the European Commission's BIOMED research programme, the EURODEM prevalence research group (with participants in six EU countries, and to a partial extent in six others) has pooled and re-analysed original data of prevalence studies of dementia in European countries between 1980 and 1990. They reached a consensus on a core methodology for the prevalence of Alzheimer's disease and vascular dementia. The study included two assessments of the population, at least 2-3 years apart, a sample size of >4000, the inclusion of community and institutional dwellers, a two-phase case-finding figure and common screening and diagnostic methods.

4.3.4 Estimation of % of persons with a disability – 1992

Source: EUROSTAT on the basis of national surveys and census in Member States (a) 1991

4.3.5

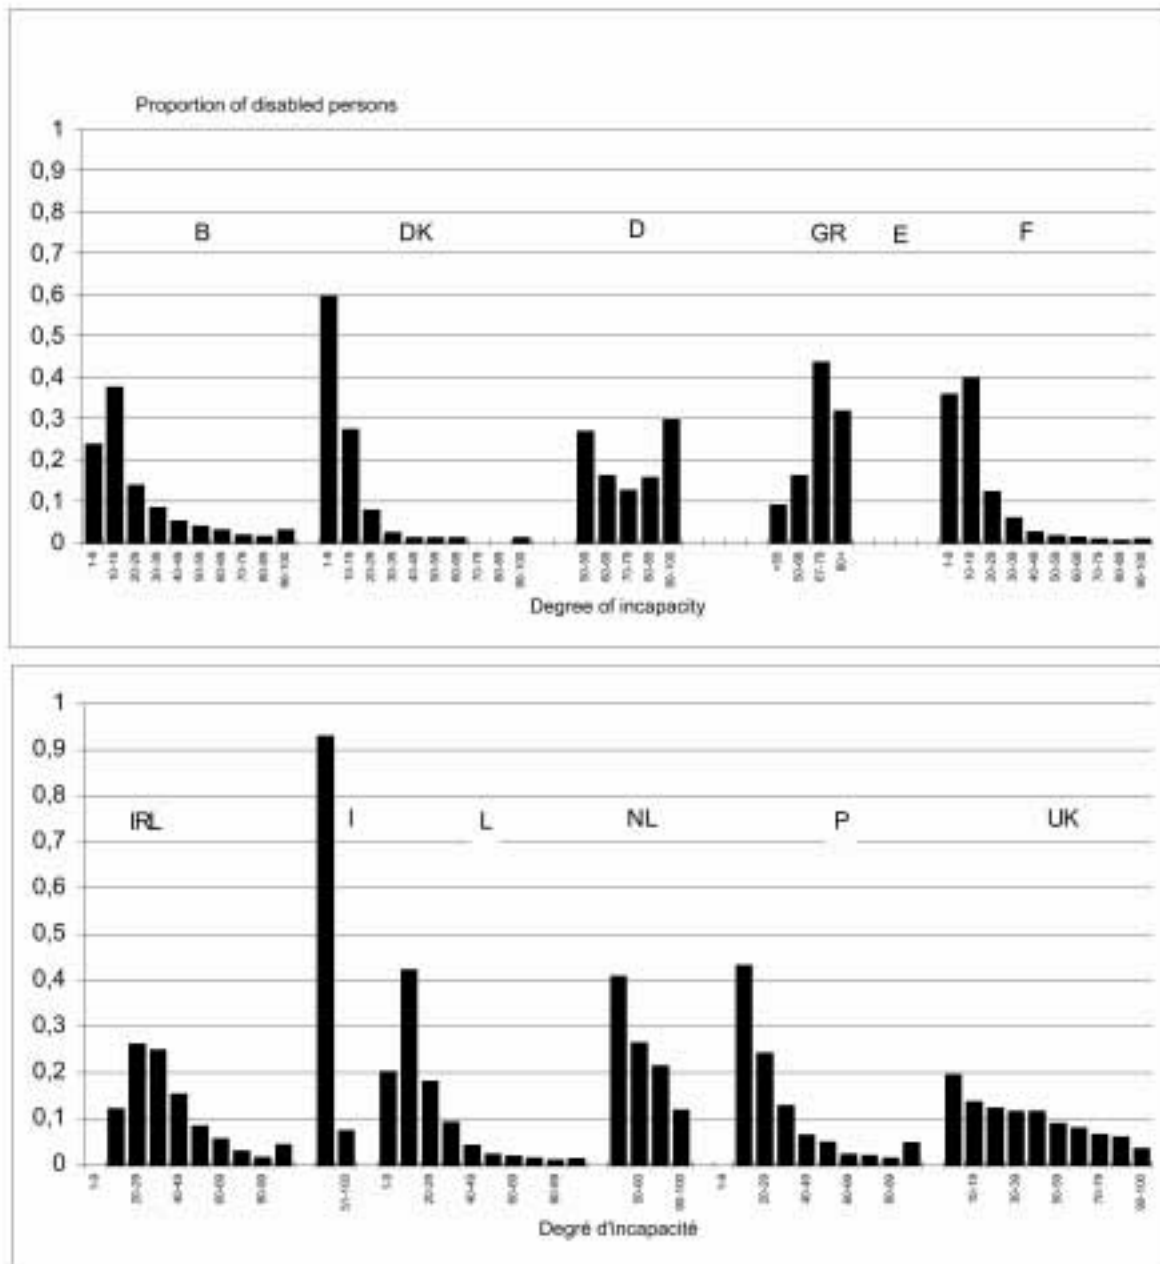

Estimation of population of disabled persons receiving financial aid linked to a disability - 1991, (<60 years) (% of total population)

Source: Eurostat (Gramenos Report), 1993

4.3.6

Breakdown of disabled persons by degree of disability - 1992

B: Persons receiving supplementary occupational accident allowances and occupational illness persons

DK: Occupational accident pensions; 1989

D: Severely disabled persons; 1991. Not including the New Länder

GR: Number of recognised disabled persons in 1991. The categories are: <50%, 50-66%, 67-79% and 80+

E: Data not comparable

F: Occupational accident pensions

IRL: Persons receiving the disability allowance; 1990. First % degree under 20%.

I: Occupational disablement pensions: degree: 11-50% and 51-100%; 1998

L: Injured persons' pensions, 1991.

NL: Physically disabled persons: 1986-1988. The breakdown by degree refers to: minor, moderate, severe and very severe.

P: Persons receiving pensions for occupational accidents and occupational diseases; 1988.

UK: Adults experiencing restrictions in their everyday activities: 1985.

Source: Eurostat from Ministries and institutions related to social security

4.3.7

Total visually impaired population - 1994, per 100 000 of total population

(1) Central vision acuity in both eyes less than 0.5 of normal sight-after correction

(2) Visual acuity lower than or equal to 6/60

(3) Visual acuity of 2% or less of normal sight and other impairments of visual acuity of the same gravity

(4) Visual acuity inferior or equal to 1/10 for each eye or nil at one eye and inferior or equal to 2/10 at the other

(5) Visual acuity less than 1/20 of normal sight in both eyes after correction

(6) Visual acuity less than 2/20 of normal sight in both eyes after correction

(7) Visual acuity less than 1/10 of normal sight in both eyes after correction

(8) Visual acuity less than 1/10 of normal sight in both eyes after correction or visual field inferior to 100

(9) Visual acuity less than 1/10 of normal sight in both eyes after correction or visual field inferior to 200

(10) Visual acuity less than 0.05

(11) Visual acuity less than 1/10 of normal sight in both eyes after correction or visual field inferior to 100

(12) Visual acuity of between 3/60 and 6/60 Snellen and a full field of vision or 6/60 and 6/24 Snellen and a moderate contraction of their field vision

Source: European Blind Union, Paris (France)

4.3.8

Percentage of persons declaring a permanent disability for work over total population, by sex - 1997

No data for France and Sweden

MORTALITY **5**

V. MORTALITY

1. INFANT MORTALITY

According to Eurostat demographic data, the infant mortality rate for the 3.9 million births observed in the EU in 1998 was 5.2 per 1 000 births. This has decreased over the past thirty years from 34.5 in 1960 to 12.4 in 1980 and 7.6 in 1990. In 1998, most EU countries had rates close to the EU average. Greece (6.8), Ireland (6.2) and Portugal (6.0) had the highest rates. In 1996 (latest available year by cause) the main causes of mortality of children under one year were: perinatal diseases, congenital malformations and chromosomal abnormalities and symptoms, signs, abnormal findings and ill defined causes (which includes the sudden infant death syndrome) for both boys and girls.

The sudden infant death syndrome (SIDS) crude death rate in 1996 in EU 15, was 5.5 deaths per 10 000 live births. Luxembourg (8.8) and Germany (8.7) have the highest rates and Portugal and Italy have the lowest. Diseases of the respiratory system, of the nervous system and accidents are responsible for a low proportion of infant deaths. SIDS was responsible for 10.4% of deaths for boys and 6.9% deaths for girls in 1996.

The perinatal mortality rate is also decreasing significantly. In 1992 (the most recent figure for EU as a whole) it was 7.6 per 1000 births compared with 35.4 per 1000 in 1960. This decline applies to most Member States. The same decreasing trend is observed with the neonatal mortality rate from 20.3 per 1000 in 1960 to 4.2 per 1000 in 1992, the early neonatal mortality rate from 16.2 per 1000 in 1960 to 3.2 per 1000 in 1992 and in the late foetal mortality rate from 19.5 per 1000 in 1960 to 4.7 in 1995 per 1000.

Data are collected by Eurostat. *Infant mortality* is the mortality of live-born children who die in the first year of life. It is computed as the ratio of deaths to children under one year of age per 1 000 live births in a given period. *Perinatal mortality* includes late foetal deaths and early neo-natal deaths (i.e. live-born children who die within a period of one week after delivery). It is calculated by dividing the total number of late foetal deaths and early neo-natal deaths by the total number of births (i.e. stillbirths and live births). Due to differences in the definition of late foetal deaths, perinatal mortality figures are not completely internationally comparable. The *neonatal* and *early neonatal mortality rates* represent the rate of deaths within 28 days, and within one week after birth respectively, per 1000 live births in a given period. A number of countries are in process of reviewing their definitions distinguishing between spontaneous abortion, *early foetal death* and *late foetal death* (or still birth), the criteria used in Member States goes from a minimum gestation period from 22 weeks (154 days) to 28 weeks (196 days).

2. MORTALITY BY CAUSE

According to the data collected by WHO (data at national level) and Eurostat (data at national and regional level) overall mortality has fallen over the past thirty years. According to Eurostat, in 1996, circulatory diseases were the most frequent cause of death (38.6% for men and 46.1% for women. External causes (accidents, disasters and others) account for 6.3% of deaths among men and 3.6% among women. Mortality patterns differ significantly according to age and sex. In 1996, the standardised mortality rate for women was lower than that of men in all cases, irrespective of the cause. After the first year of life, mortality reaches a minimum between 5 and 10 years of age, and it increases with age thereafter.

In general, mortality patterns are dominated by four main groups of causes of death: circulatory diseases (including ischaemic heart and cerebrovascular diseases), cancer, respiratory diseases and external

causes (including accidents and suicides), which together account for more than 80 % of deaths. These disease groups are strongly related to life styles, the first three groups are related to smoking and diet. Deaths from cancers and circulatory diseases dominate the higher age groups, accidents and suicides represent more than half of the deaths in the younger age groups (15-34 years of age) for both men and women.

Ischaemic heart diseases (IHD) (mostly acute cardiac infarction) account for nearly half of all deaths from cardiovascular disease. It is the largest single cause of death for people in the EU, accounting for 16.6% of all deaths in 1996. However, mortality rates for IHD have been declining for more than ten years in some EU countries. More recently, this trend has become apparent in the majority of EU countries, although it is more noticeable in younger age groups, in men and in the northern European countries.

Of the 3.730 million deaths that occurred in 1996 in the EU, 42.4% (1.582 million) were due to diseases of the circulatory system and 24.9% (0.930 million) to malignant tumours. However, causes of mortality vary greatly depending on age, sex and region. Violent deaths (suicides and accidents) are the largest cause of death among young men aged 15 –24 (58.3%). The incidence of death from cancer increases with age, accounting for half of all deaths of women aged between 45 and 54.

In terms of proportion of total deaths, in the EU in 1996, for children aged 1-4, accidents are the primary cause of death (23.5%), followed by congenital defects (15.1%) and tumours (12.4%). However, in Portugal and Spain, infectious and parasitic diseases are more prevalent than tumours, unlike the other Member States, where they are virtually non-existent. Most of the accidental deaths amongst children aged 1-4 are a result of motor vehicle traffic accidents on highways, suffocation and obstruction, and falls. In the 5-14 age group, accidents (mainly road accidents) are most common (31.6%) followed by tumours (particularly leukaemia) accounting for 19.9% of deaths.

For deaths recorded in 1996 for European males in the 15-24 age group, 49.9% were due to accidents and 12.8% to suicide, the second most common cause of death amongst males of this age. Accidents are also the prime cause of death amongst women (35.8%) and malignant tumours the second (13.7%). Less women (9.7%) in this age group die from suicides than men (12.8%). Disparities for this age group are more pronounced between the sexes than between countries.

The 25-34 age group appears to constitute a transitional group where the most common causes of death amongst men are accidents (27.5%), suicides (14.8%), AIDS (13.7%), and circulatory diseases (7.6%). This age group has the highest suicide proportion and the only significant AIDS proportion. Amongst women 25-34 year-old, tumours (22.0%) are the prime cause of death, followed by accidents (15.6%), suicides (10.2%), AIDS (12.1%) and diseases of the circulatory system (9.9%). Amongst 35-44 year-olds, 19.9% of all female deaths are due to cancer and 6.8% to diseases of the circulatory system. Amongst men, tumours (18.5%), suicides (13.6%), diseases of the circulatory system (17.7%) and accidents (13.6%), account for not so similar shares. Mortality amongst the 45-64 year-olds, both sexes, is largely due to tumours (42.2%) and diseases of the circulatory system (27.8%). Finally, amongst both men and women over 65 years of age, diseases of the circulatory system (47.2%) and tumours (22.4%) are the primary cause of death. Accidents account for much fewer deaths than in the preceding age groups, although the absolute level is not negligible at 63 721 deaths.

Of malignant tumours, breast cancer accounts for the greatest number of deaths amongst women, and lung cancer amongst men. As for diseases of the circulatory system, acute myocardial infarctions and other ischaemic cardiopathies are most common, followed by cerebrovascular disease for both men and women.

In terms of standard death rates (SDRs) in 1996, slightly more women than men die from diseases of the circulatory system. The highest mortality rates for these diseases are found in Ireland and Finland, and the lowest in Belgium and Spain. The pattern is not, however, the same for ischaemic heart disease or cerebrovascular disease. Relatively clear differences emerge between countries according to sex and the location of tumours. The SDR of breast cancer, for women, is particularly high in Denmark and the Netherlands, and low in Greece and Portugal. SDRs from lung cancer are highest in Belgium and the Netherlands amongst men. Pneumonia, bronchitis and asthma, have the highest SDRs for men in UK (73.8 deaths per 10 000 male population).

The SDR from AIDS is high in Spain (21.1 for men and 5.2 for women), Portugal (18.4 and 3.7) and Italy (11.3 and 3.5). There is a particularly large disparity between male and female deaths from AIDS in EU15 (7.2 against 1.8). In contrast, deaths due to diabetes are nearly the same for both men and women (15.2) and (13.5) respectively. The most affected countries are Portugal (24.1 for men and 22.8 for women) and Germany (21.0 and 18.2). The SDRs from accidents, for women, were highest in France (25.3) and Finland (22.9) and, for men, highest in Finland (68.0) and Luxembourg (56.8). More men than women commit suicide, the highest SDRs being, for men, in Finland (37.1) and Austria (33.2) and, for women, in Finland (10.3) and Belgium (10.2). The ratio of male to female suicides is 3.1 for EU15 and varies from 2.0 in the Netherlands to 5.0 in Greece, although female suicide is perhaps underestimated in statistics.

In terms of crude death rates (CDRs) and according to 1995 regional Eurostat data, NUTS 2 level, the regions with the highest crude number of deaths per 10 000 inhabitants for some selected causes of death are in the case of men: Lisboa (P) and Provence-Alpes-Côte d'Azur (F) for infectious and parasitic diseases, Liguria (I), Toscana (I) and Bretagne (F) for cancer, Voreio Aigaio (EL) and Asturias (E) for lung cancer, Mellersta Norrland (S) and Norra Mellansverige (S) for ischaemic heart disease and Itä-Suomi (FI) and Bretagne (F) for suicides. In the case of women: Region Bruxelloise (B) and Limousin (F) for infectious and parasitic diseases, Liguria (I) and the Highlands Islands (UK) for cancer, Merseyside (UK) and Dumfries and Galloway (UK) for lung cancer, Itä-Suomi (FI) and Lancashire (UK) for ischaemic heart disease and Bretagne (F) and Liège (B) for suicides.

3. SPECIAL CAUSES OF DEATH

According to Eurostat statistics on causes of death, the absolute number of deaths due primarily to alcoholic abuse (including alcoholic psychosis) in 1995 was 8 831 for men and 2 297 for women in the EU. The number of deaths due to alcoholic abuse increases with age, with the age groups 50-54 and 55-59 for both sexes being particularly affected.

According to the data provided by the EMCDDA (European Monitoring Centre for Drugs and Drug Addiction) and the Trimbos Institute (NL), many EU countries experienced fluctuations in the number of drug related deaths from 1985-1997. The frequency and quality of post-mortem analyses (autopsy, histological, serological and toxicological analyses) are of paramount importance for correctly detecting and classifying drug-related deaths. It is also important to notice the lack of a unique definition of the term drug-related death and the lack of consensus regarding which types of death should be included.

Data on absolute number of deaths are collected by the WHO (at national level) and by Eurostat (at national and regional NUTS 1 and NUTS 2 level). The coding is based on the *initial cause of death* (section b) of the death certificate. Causes of death are defined on the basis of the WHO's *International Classification of Diseases (ICD)*. All EU countries use the ninth or the tenth revision of the Classification.

The *standard death rate* (SDR) is the death rate of a population of a standard age distribution. As most causes of death vary significantly with people's age and sex, the use of standard death rates improves comparability over time and between countries, as they aim at measuring death rates independently of different age structures of populations. For reasons of international comparability SDRs used here are calculated by Eurostat on the basis of the standard European population as defined by the WHO.

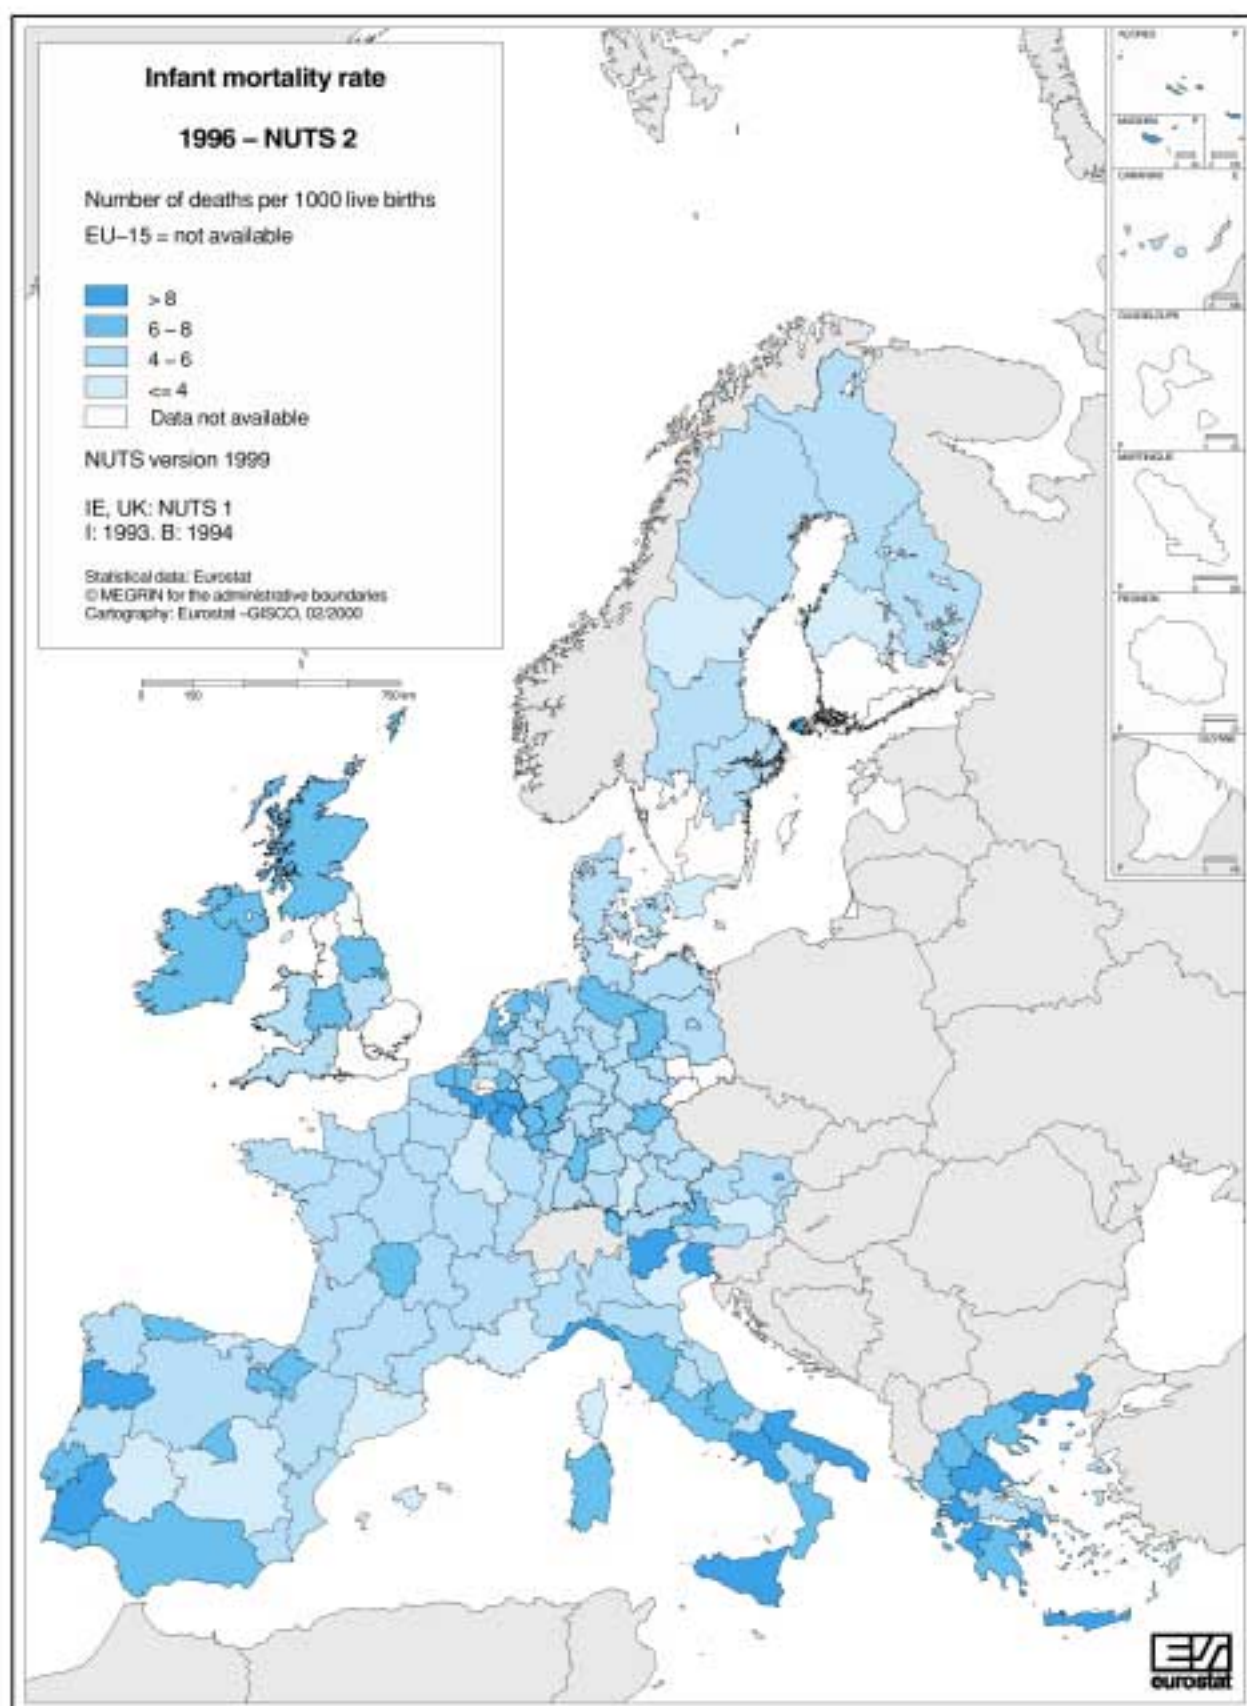

The *crude death rate* (CDR) is a weighted average of the age-specific mortality rates. The weighting factor is the age distribution of the population whose mortality experience is being observed. To compare the CDR from two or more populations (at the NUTS 2 level in this publication) is a comparison of a combination of different age-specific death rates and different population structures not reflecting the 'real' mortality differences but including also the effect of the population structure on the total number of deaths and on the crude death rates.

HEALTH CARE **6**

VI. HEALTH CARE

1. HUMAN RESOURCES

According to the Eurostat Labour Force Survey (LFS), 14 200 million people were employed in the health and social work sector in EU-15 in 1998, representing 9.4% of total employment in EU15. These figures include employees (wage earners) and independent professionals. The highest percentage of health care workers is found in Sweden (19.2%) and the lowest in Portugal (4.1%). Data for the period 1993-1998 show a slow increase in the percentage employed in the health and social work sector (Sweden being the only exception).

Between 1980 and 1997, the available number of physicians, dentists, nurses and pharmacists, collected by Eurostat mainly from register sources, increased in all the Member States of the EU. The density of manpower in the field of health care varies widely from one Member State of the Union to another. In 1996, there were between 174 (UK) and 421 (Spain) physicians per 100 000 inhabitants in the EU. The figure for Italy (570) is not fully comparable, since it includes dentists. Compared to 1985, these figures have increased in all the Member States. The age and sex distribution for 9 EEA countries in 1996, shows that 62% of physicians are under 45 years of age; in every age-group male physicians outnumber their female colleagues. Under 35 years of age, the difference between both sexes is small but after 35 years of age the difference increases fast. According to 1996 regional Eurostat data, NUTS-2 level, data on number of physicians per 1000 inhabitants are detailed in the annexed map.

The number of dentists has increased in all EU countries since 1991. The distribution of the density of dentists does not follow the same pattern as that for physicians. There are very few dentists in Portugal and Spain (30 and 39 per 100 000 inhabitants respectively). The highest number of dentists per 100 000 inhabitants can be found in Greece (109 per 100 000) and Sweden (103 per 100 000).

The number of pharmacists has increased in all EU countries since 1980. The largest number of pharmacists per 100 000 inhabitants can be found in Belgium and Sweden (143.5 per 100 000).

For nurses, data are not available for the majority of EU countries, Finland (1 355) has the largest number in contrast to Portugal (301). Little information is also available for physiotherapists, but it seems that the Nordic countries have the largest numbers (176.8 in Finland and 104.5 in Norway) in sharp contrast to Spain (5.3) and Austria (24.7). It should be noted that differences in concepts and lack of data hamper comparability.

Eurostat collects statistics on health manpower. The Member States of the EU base their statistics in the field of health care on different concepts and registers. In eight of the Member States (Belgium, Denmark, Germany, Greece, France, UK, Sweden), the *number of physicians* means the number of active practitioners, i.e. both practitioners with a medical practice and those working in industry, research or administration. Furthermore in Ireland and Luxembourg, the figure includes only practitioners with a medical practice. In other five Member States (Spain, Italy, Netherlands, Portugal, Finland) the figures include practitioners "entitled to practice", which includes practitioners who are unemployed, retired or work without directly practising medicine as well as those who actually have a medical practice. In the UK and Ireland, only the public sector is counted. Similar methodological differences can be observed in the case of *dentists* and *pharmacists*. In the case of *nurses* different Member States mix health care personnel performing nursing and caring tasks: NRGK, second level nurses and specialist nurses, but also other categories of caring personnel. For *physiotherapists* the tasks performed in every Member State can differ.

2. FACILITIES AND USE OF SERVICES

Immunisation coverage

According to Eurosurveillance data, strategies for achieving a reduction for poliomyelitis, diphtheria, neonatal tetanus, measles, mumps and congenital rubella are defined in terms of targets for immunisation coverage, epidemiological surveillance, and control measures to be implemented in the event of an epidemic. A target of at least 95% immunisation coverage of children at 2 years of age is to be achieved in each EU country. In March 1996, five Member States had achieved immunisation coverage of at least 95% for diphtheria, tetanus and pertussis (DTP vaccination) in children under 1 year of age, but in four Member States the coverage for pertussis vaccination is still less than 80%. A total of 15 cases of diphtheria were reported in the EU in 1996 (17 in 1995, 15 in 1994 and 20 in 1993). Coverage of pertussis vaccine is about 50% in Italy and Germany. Coverage is 95% or over for poliomyelitis vaccination in eight Member States, and it is lower than 80% in only one Member State. Member States of the EU reported no cases of poliomyelitis after 1989. Coverage of measles vaccination is at least 95% in 2-year-old children in Finland and Sweden, whereas five Member States have coverage of less than 80%. Few countries present data on immunisation coverage against Hib or hepatitis B. Data on coverage with two doses of measles, mumps and rubella (MMR) vaccine are not systematically available although such a schedule has been implemented for several years in 10 of the 15 Member States.

Immunisation coverage has been defined as the proportion of a population (or sub-population, however defined) that has been vaccinated. In countries where public health data are computerised and actively managed, the results cover the entire child population precisely, for example in Denmark, the Netherlands, and the UK. In countries where computerised public health records are confidential, indirect methods have to be used. This is why it is essential to validate coverage data either systematically or periodically. Systematic measures are taken in Denmark, Finland, France, Ireland, Italy (compulsory vaccines), the Netherlands, Portugal, Sweden, and the UK. In Austria, Belgium, Germany, Greece and Spain, where many vaccinations are given by the private sector, coverage is mainly assessed by estimating the number of imported or distributed vaccines. In Italy, the same method is used to assess the coverage of MMR vaccination. Finally, in Belgium, Finland, France, Greece, and Italy, estimates of coverage are validated by performing ad hoc surveys of representative samples. This is the only method of assessment in Luxembourg. These surveys are conducted every year or more, according to the country. The Regional Office of the WHO for Europe collected annual coverage data relating to children under 1 year of age for diphtheria, tetanus, and pertussis (DTP), poliomyelitis, and BCG vaccinations, and children under 2 years of age for MMR vaccine. The WHO's coverage data were last updated in March 1996 and included information on immunisation coverage for 1995, 1994, or earlier years. All countries report coverage data for children who have received three doses of DTP and poliomyelitis vaccines, and MMR vaccine, and BCG is reported by four countries where policy is to vaccinate all newborn babies. In addition, some countries report immunisation coverage of vaccines against *Haemophilus influenzae type b* (Hib) and hepatitis B virus.

Preventive examinations

In the 1996 Eurobarometer survey a number of additional questions were included to shed light on prevention against diseases such as cancer. The results - to be interpreted with care due to small sample numbers - show wide divergence between the Member States.

The third EU action plan against cancer (1996-2000) has assigned priority to early detection and screening of cancer. In existing screening programmes, effectiveness is strongly influenced by the participation rate of

the targeted population. A participation rate of 60% is acceptable, but 75% (or greater) is desirable and only reached in countries with systematic screening programmes with personalised invitations. Results of the 1996 Eurobarometer survey indicate that during the last 12 months 16.0% of Europeans had been screened for cancer in 1996. The highest proportion is reported in Germany (35.3%), and the lowest in Ireland (5.2%).

The results of heart check-up in 1996 show that the level of people tested is highly age-dependent with more than 44% of people aged over 65 tested compared with only 10% of people under 35. The highest rate of heart check-up is reported in Germany (29.6%) and the lowest in the Netherlands (13.7%).

20.1% of people in EU have been tested for diabetes in 1996. The results for people aged under 40 (12.5%) and aged 65 and over (36.6%) may highlight the need to increase diabetes testing in middle-aged people and older, especially women and particularly those who are overweight. Luxembourg (33.7%) and Germany (30.5%) have the highest rate of testing while Ireland (7.2%) and Denmark (12.3%) have the lowest.

25.5% of Europeans report having had a cholesterol test in 1996 with wide differences between Member States, from 38.5% in Austria and 35.8% in Luxembourg to only 9.2% in Denmark.

Dental check-up (at least one time during the last 12 months) is the most frequent preventive examination in Europe (57.8%), with 6 countries reporting more than 70%: Denmark, Sweden, the Netherlands, Luxembourg, Germany and Austria. The lowest values are in countries where check-ups are under-reimbursed by the social security schemes e.g.: Portugal (33.3%) and Spain (36.4%)

The remaining preventive examinations show different values in EU: eye test by an optician or doctor (34.2%), blood test (43.5%), X-ray examinations (22.7%), hearing test (11.0%) and urine test (33.2%).

Preventive examinations in women

Age-related osteoporosis occurs more frequently in women than in men. 8.3% of women (and 17.0% aged over 50) have had an osteoporosis examination according to the Eurobarometer survey in 1996. This percentage varies in the case of women from 15.6% in Austria to 2.3% in Ireland.

Gynaecological examination appears to be the most frequent preventive examination in case of women (44.1% for EU15) even if in some countries such as Ireland (10.6%) and the Netherlands (19.2%) the rates are low.

Breast cancer screening may be performed by physical examination of the breast or by mammography (X-ray). 36.6% of women in EU15 reported having performed a breast examination by hand and 17.8% by X-ray in 1996. The rates vary slightly across the age groups ranging from 29.8% among women aged 60 and over to 48.4% among women aged 50-59 years. Within the EU the rates range from a high 50.5% (by hand) in Germany to a 15.3% in Ireland and from a 30.6% (by X-ray) in Denmark to 4.4% in Ireland.

A main cause of cancer of the cervix is infection of the cervix with human papilloma virus (HPV) particularly types 16 and 18. Cervical cancer may be detected by a Papanicolau smear test. At an EU level, 36.4% of women reported a cervical smear test in 1996. Again considerable variations can be observed in Member States as well with Danish (61.9%) and French (50.6%) women reporting the highest and Ireland (14.7%) and the Netherlands (23.0%) the lowest.

Hospitals and hospitalisation

According to Eurostat, the available resources, in terms of the number of hospital beds per head of population, vary widely from one Member State to another. In Luxembourg, Finland and France there are

over 1 153, 928 and 906 hospital beds for 100 000 inhabitants – approximately double the number in Spain, Portugal or Greece. Over the period 1980-1995, there was a slight reduction in the number of hospital beds per inhabitants in the EU. The number of psychiatric beds also decreased, Belgium and the Netherlands having the highest figures. The reduction of beds can be explained by developments in medical technologies which have made it possible to reduce the average length of hospitalisation for a given disorder. Another reason is the financial constraints of the 1980s, which led to rationalisation of the health services. According to 1996 regional Eurostat data, NUTS 2 level, data on hospital beds per 1000 inhabitants are given in the annexed map.

Data on the *number of beds* collected by Eurostat are normally given as an annual average. The comparability is weak and must be treated with caution due to the different concepts for 'hospital' and 'hospital bed' in the EU countries. In general, however, changes in the number of beds are accounted for *pro rata temporis*. Bed-counts include only beds used for full in-patient accommodation. The figures for 'total hospital beds' refer to all beds (except cots for healthy infants) in general, university and specialised hospitals, mental hospitals, institutions for the mentally weak (mentally deficient), nursing homes and others. Beds in hospitals available for nursing day-care, medical childrens homes, nurseries for toddlers under medical supervision and institutions for the sensorially-handicapped, are not necessarily included.

The average length of stay, according to OECD Ecosanté Database, was between 35 days in the Netherlands and 10 in Ireland in 1980. In 1996, this range had fallen to between 33 days in the Netherlands and 7 days in Denmark and Ireland. Divided into 17 main groups following the ICD-9 Classification, the highest average length of stay in 1996 is recorded for the mental disorders in a range from 99.0 days in Greece, 86.4 days in UK or 73.4 in Spain to 7.3 in France or 7.7 in Denmark, probably due to different structures in the psychiatric care. Congenital anomalies, injuries and poisoning and the diseases of the circulatory system presents also high lengths of stay in hospitals.

Admission rates per year, provide a measure of hospital turnover. Even though the admission rates increased in almost all countries, lower number of days spent by patients in a hospital came about through a substantial reduction in the average length of hospitalisation. The relation between number of beds and admission rates is not so clear. Finland, Austria, UK, France, Germany and Belgium have the highest rates of admission in hospital (over 20% of population per year). The Netherlands has 11.0% but having a very large nursing sector. The lowest hospital admission rates are found in Portugal and Spain.

In terms of frequency of admission, (discharges from hospitals) divided into 17 main groups following the ICD-9 Classification, diseases of the circulatory system comprise the highest frequency of admission followed by admissions for cancer, traumas and poisoning.

The *average length of stay* calculated by OECD is defined as the number of bed days in hospitals divided by the number of admissions or discharges according to data from hospital or morbidity surveys in EU countries. *Admission rate* calculated by OECD according to data from hospital or morbidity surveys in EU countries is defined as the number of admissions (or discharges) to hospitals divided by the population and multiplied by 100. Comparisons of diagnosis between various geographic areas are difficult and contain a number of potential sources of error, e.g. differences in classifications, quality of the registers, use of different codes for the same type of diagnosis and variations from one country to another in the way of counting diagnosis in hospitals.

The data collected from information on discharges from hospitals are based on cases which can include, in most of the countries, re-admissions of the same person. Data based on surveys as the ECHP generally contain no information on the causes for hospitalisations but are based on single person related data.

According to 1994 results of the ECHP 10.2% of Europeans (for EU 12) have experienced a hospitalisation during the last 12 months. The proportion ranges from 7% in Portugal up to 13% in Germany and 15% in Luxembourg. These differences may partly reflect the differences in organisation of health care services. Therefore, with caution it could be said that the figures are lower in the southern Member States of the EU (EU12) and in the Netherlands than in the other Member States. Up to and including the age group 45-54 years, women have higher hospitalisation rates than men; after that, men have the higher rates, especially in the age group 75-84. In 1996, for EU 15 (without Sweden) the average number of nights spent in a hospital during the last 12 months was 14 nights. The average length of stay is identical for men and women.

The ECHP (*see chapter IV for more details*) is a longitudinal, multi-subject survey covering many aspects of daily life, particularly employment and income, but also demographic characteristics, environment, education and health. The health section of the ECHP contains also questions on *hospitalisation in the 12 months preceding the interview*. Figures for *hospitalisation* from surveys such as the ECHP, have some limitations i.e. the fact that persons living in institutions are not included in this surveys. This leads to small underestimations.

Satisfaction with health systems

The results of the Eurobarometer Survey 1998 illustrate a general evaluation of the national health system without specific reference to issues such as equity, efficiency and satisfaction with different levels of care. Greece, Italy, Ireland, and Portugal show the lowest levels of satisfaction; they also rank lowest in per capita health expenditure in PPP. However, the percentage of those who are neither satisfied nor dissatisfied in Spain (39.2%) is the highest in the EU. Austria shows the highest level of satisfaction (70.6%), although health spending is lower than in Luxembourg (50.7%) or Germany (43.2%), which show a lower level of satisfaction despite having the highest health expenditure per capita.

It is also worth noting that, according to the results of the Eurobarometer Survey 1996, a majority of citizens in the EU believe that people use health care facilities too frequently. This is not, however, the view of the majority of citizens in Portugal, Finland and Sweden.

There is wide diversity of satisfaction with current health services and the role of private organisations and government agencies.

Technological outputs

Part of the effectiveness of health treatments could be due to the introduction of new technologies. Technology assessment includes the evaluation of technical performance, clinical efficacy, safety, economic efficiency, organisational impact, social consequences and ethical implications. Data on some medical high-tech facilities are however sparse.

The OECD Health Data 99 provides information on the number of computer tomography (CT) *scanners*, a diagnostic device that combines X-ray equipment with a computer and a cathode ray tube

to produce images of cross-sections of the human body. Data are collected on the number of types of radiation treatment equipment, on lithotriptors and on the number of magnetic resonance imaging (MRI) equipment - a diagnostic device based on nuclear magnetic resonance that provides images without the use of ionising radiation.

Home care

All EU countries are confronted with an increase in demand for home care; the main reasons are the ageing population, smaller family size and increased female participation in the labour market. Another reason for substitution of hospital care by home care is an attempt to control health care expenditures. There are differences among the countries in definition of home care. According to NIVEL (Netherlands Institute of Primary Health Care) whose data (see Annex II) are used in this publication, home care is restricted to the care provided at home by professional home-nursing organisations and home-help services. Services included in home-help and home-nursing are described in the Annex. There are large differences between EU countries in the development of home care services. In countries such as Denmark, the Netherlands, Belgium, Finland, Ireland, Sweden and UK home-nursing and home-help services are fairly developed compared to Austria, Greece, Italy and Spain. There are also large differences among the countries regarding the level of co-ordination of home-nursing and home-help services. A major problem in many countries is the separation between health and social services. Whereas home-nursing is mostly financed by general taxation or social insurance, home-help services are usually administrated and financed by the local government or by voluntary organisations. In general there are also large differences between the countries on the financing of home care.

Consultations of health professionals

Main indicators are mean number of consultations to a health professional during the last 12 months. According to the 1995 results of the ECHP the percentage of persons having consulted a doctor, a dentist or an optician during the last 12 months was 88% on average for the 12 countries participating in the survey. The average number of visits for the 12 countries participating in the survey to a general practitioner is 4.2 to a medical specialist 1.9 and to a dentist 1.4. The frequency of visits to health professionals is especially high in Germany, where 95% of the population has consulted a health professional (34% more than 10 times), the average values being 5.1 for doctors and 3.2 for specialists. The frequency of visits is also high in Denmark, Luxembourg, the Netherlands, Austria and Belgium. Greece is the country with the lowest frequency (67% of population for an average number of 2.2), followed by Ireland and Spain.

According to the Eurobarometer Survey 1996, the persons surveyed agree strongly (25.8%) or slightly (34.9%) with the statement that the time spent by doctors discussing preventive action and healthy lifestyle with their patients is generally not enough. The highest percentages are to be found in Spain (76.2%), and the lowest in Sweden (48.0%). These results require further analysis, and more detailed studies should be initiated to examine what the public believes the role of the doctors should be concerning preventive action and health improvement and promotion.

Consumption of pharmaceuticals

The medicines per person expressed in terms of number of containers seems to follow a pattern similar to pharmaceutical expenditure figures, even if these figures are very difficult to compare in view of different

criteria in the Member States. France (52.0 in 1995) has the largest consumption of containers of medicines per person, followed by Spain (26.5 in 1996). Sweden (6.4 in 1996) and Denmark (7.4 in 1996) have the lowest levels.

According to OECD Health Data 99 there is no ideal definition for this time series. The data collected refer to the number of containers (items or packages) or the number of prescriptions (some of which are renewable) per person. No standard definition has been set by the WHO Collaborating Centre for Drug Statistics Methodology. The Defined Daily Dosage (DDD) provides a measure of the volume of pharmaceutical consumption on the domestic market per thousand adult population, as classified by the Anatomic Therapeutic Classification (ATC). However figures are, for the moment, inaccurate.

Data on drug sales through retail pharmacies are collected by the private firm IMS Health for some selected markets expressed in US\$. According to the Drug Monitor of IMS-Health: from January to December 1998 a growth of 7.0% in drug sales was reported in the 5 most important European markets. Spain (11%) experienced the highest increase followed by UK (8%), Italy (8%), Germany (6%) and France (4%). On the major therapy classes experiencing growth over this period, genito-urinary drugs increased by 10% (19% in USA), cytostatics increased 10% due to the new products (β -interferons and others) for treatment of breast- and other cancers, anti-infectious medication increased from 5% due to increasing use of cocktail therapies used in HIV infections and the launch of new vaccines. Alimentary and metabolic medication grew by 5% as a result of the recent launch of some anti-obesity preparations.

From January to December 1999, IMS Health has reported, again, a 7% growth in drug sales (valued at \$52.4 billion) through retail pharmacies in the 5 most important European markets. Growths in Spain (11%) and UK (10%) were the most significant. On the major therapy classes in 1999, the class referring to drugs for musculo-skeletal diseases experienced the highest level of growth up 19% from the previous year

IMS Health provided data on the sales of medicinal products by retail pharmacy outlets. These figures are taken from the monthly pharmaceutical audit conducted by IMS Health and cover the 12 months period from January 1998 and 1999 through to December 1998 and 1999. All sales values are shown in millions of dollars at prevailing exchange rates. In order to remove the effects of fluctuating exchange rates, growth rates are calculated net of exchange, in other words, growth figures are shown at local currency level or constant exchange.

The use of medicines without a doctor's prescription is increasing. According to Eurobarometer Survey 1996, 13.0% of Europeans declared that they had consumed medicines without a doctor's prescription during the last two weeks preceding the survey. This percentage is greater for women (15.2%) than for men (10.7%). The Spanish (19.0%) are the highest self-consumers of medicines, especially in the case of women (22.7%). The lowest consumption of unprescribed medicines is in Ireland (6.3%) and in the Netherlands (6.5%). 6.7% of Europeans declare that they consume vitamins without a doctor's prescription [women (7.9%) - men (5.4%)].

3. TREATMENTS AND MEDICAL PROCEDURES

Caesarean sections

According to WHO the number of caesarean sections per 1 000 live births in the EU has increased from 94.4 in 1980 to 179.4 in 1996. The Member States with the highest rates are the Southern countries:

Portugal (275.3), Italy (274.1), Greece (240.0 in 1991) and Spain (188.0), lowest figures were in Luxembourg (16.9) and Ireland (49.4).

Organ transplants

According to Eurostat during 1997, kidney transplants remain the most frequent type of transplant (living donors represent less than 8%). On the average for every one million Europeans, there are 30 kidney transplants, slightly more than 6 heart transplants, almost 11 liver transplants and between 1 and 2 lung transplants. Spain, Austria and Belgium/Luxembourg have the highest transplantation rates for all organs in EU. Greece has the lowest rates.

Eurostat collects this information on the basis of results disseminated from different specialised national and international organisations (ETCO, Eurotransplant, Scandiatransplant, ITCS and the Spanish ONT). The Council of Europe has in the past developed the ethical principles governing organ transplantation. At the 3rd Conference of Ministers of Health on organ transplantation the Ministers reconfirmed the principle of non commercialisation of human organs and the need for organisational measures to increase the availability of organs. The Member States continue to co-operate in this area and particular attention is now being paid to quality control of organ transplantation.

Cardiac interventions

The data are compiled according to the fourth European Survey on open-heart surgery and the third on PTCA and cardiac catheterisation from the European Heart Institute in Salzburg (Austria). In EU, 255 181 open-heart procedures (670 per million of population) were carried out in 1995. The increase in cardiac surgery was 8%, in PTCA (percutaneous coronary angioplasty) 12% and in cardiac catheterisation, including coronary angiography, 8%. The main increase in procedures was in the area of coronary artery surgery, while congenital cases, valves and heart replacements showed only a slight increase. When comparing between Central, Northern and Southern regions of Europe, different areas of high and low density in cardiac care as well as in the number of cardiac centres can be observed.

The European Survey on cardiac interventions, open heart surgery, PTCA and cardiac catheterisation is conducted by the European Heart Institute in Salzburg (Austria) with the support of the WHO, the International Society of Cardio-thoracic Surgeons and the International Society and Federation of Cardiology. Is based on direct responses from cardio-surgical professionals (in Austria, Portugal and Greece) and from national Ministries of Health (for Belgium, Denmark, Finland, Sweden, Spain and the Netherlands) and national societies for cardiac surgery (for the remaining countries).

Dialysis

According to OECD Health Data 99 the number of patients with dialysis treatments is the sum of Hospital/Centre and Home Haemodialysis/Haemoinfiltration, Intermittent Peritoneal Dialysis, Continuous Ambulatory Peritoneal Dialysis and Continous Clinical Peritoneal Dialysis on December 31st of each year.

4. COST AND FINANCING

The health care systems

From an economic point of view a health care system can be defined as a subset of the economic system that includes all economic units involved in the production, consumption and distribution of health care. However, in most countries, health care production, consumption and distribution are not organised in a single way or according to the same sets of resource-allocation principles and mechanisms for all the population. Part of the population basically consumes health care according to free-market criteria, but some groups may have access to care under a given set of governmental regulations which include a mix of insurance, subsidiarity, monopsony and other market interventions.

A general characteristic of health care consumption is the presence of financial intermediates or third-party payers. Health care is sometimes the object of voluntary insurance; but in most countries a high proportion of the population is covered by a so-called social or mandatory insurance, where membership or entitlement is not the result of consumer decision but legally enforced. In any event, the consumer seldom pays health care directly to the provider. Most countries have more than one organisational structure for delivery of health care and for its remuneration. Hence, one has to consider the total of a country's health care systems and its subsystems, each of them following its own resource-allocation criteria and working independently of each other.

To help in an interpretation of the basic empirical information about health systems, Eurostat proposes an understanding of the underlying structures, like reimbursements, benefits, cost sharing, planning, public versus private insurance, financing methods, legal systems, etc., considered as necessary. A few aspects are highlighted here.

Health systems may be categorised according to one of three basic models:

- *National Health Service* (Beveridge) model, characterised by universal cover, tax financing, and public providers;
- *Social Insurance* (Bismarck) model, characterised by compulsory universal coverage (generally within the framework of social security), financed by employer and individual contributions through non-profit insurance funds, and public and/or private providers;
- *Private Insurance* model, characterised by employer-based or individual purchase of private health insurance coverage financed by individual and/or employer contributions, and private providers.

The prototype example of the third model is the United States. In all Member States of the EU, however, people are covered by public institutions against (most of) the costs of their treatment in case of illness.

Nine Member States (DK, E, FIN, GR, I, IRL, P, S, UK,) cover their entire population by means of a National Health Service. The southern European countries (E, GR, I, P), have adopted this type of universal cover over the last fifteen years. The national health systems involve the direct provision of services by the State, and access to the majority of health services is generally free for the entire population. Health care is financed mainly out of taxation, which can include both direct taxes (such as income tax), and indirect taxes (such as VAT). In Italy, Greece and Spain, however, financing is mixed - in other words based on both taxation and sickness insurance contributions. In Ireland, the main source of finance is taxation, but in contrast to the UK, many hospitals are in private hands. Only people with low incomes are covered for primary care in Ireland: those not covered have to pay for care received privately and a modest amount per day for hospital care received publicly. In Greece, the universal right to health care consists of access to public hospitals including their outpatient departments.

In the other six Member States (A, B, D, F, L, NL), medical coverage is through social insurance. Except in the Netherlands and Germany, social insurance covers almost the entire population. In the Netherlands, almost the entire population is insured against the risk of serious or long-term illness. At present, around 70% of the population have compulsory coverage against the risks of acute illnesses, while the remaining 30% - persons with income over a certain ceiling and self-employed persons - have (voluntary) private insurance. In Germany, 92.5% of the population is covered by social insurance against the risk of sickness (85% on a compulsory basis and 15% on a voluntary basis), and the remainder (mainly civil servants, self-employed persons and the high-income group) is covered by private sickness insurance schemes. In Belgium, the self-employed and employers are only covered for the heavy risks - in-patient care - and for certain diseases such as cancer and tuberculosis.

In all Member States, private insurance also plays a role, albeit a varied one. In some countries (e.g. the Netherlands) voluntary private insurance fills most of the gaps left by statutory insurance. In others (e.g. Austria), private insurance also provides supplementary cover to persons who already have comprehensive public cover. In other countries still (e.g. France), private insurance provides cover against public sector co-payments (*ticket modérateur*) levied on prescription medicines, consultations with a doctor, etc. In Ireland, private insurance serves all three functions. Hospital beds are over 90% publicly owned in Denmark, Finland, Sweden and the UK, between 80 and 90% publicly owned in Italy and Portugal, and the majority are publicly owned in France, Greece, Italy and Spain. About half are publicly owned in Austria and Germany. In Belgium, Luxembourg and the Netherlands, most of the acute hospitals are private. In Belgium, France, Germany and Luxembourg, patients can go directly to a specialist. In the other Member States access is normally by referral from a general practitioner (gatekeeper-mechanism).

The method of paying general practitioners is indicated in the tables. Doctors can be faced with changing incentives by altering the method by which they are paid. In six countries, they are paid on a capitation basis. This is a fixed payment for each listed or enrolled person served per period of time. Payments will vary according to the number of patients enrolled but not with the number of services rendered per patient. In five countries, mainly with a National Health Service, doctors are paid by salary. This payment does not vary either with the number of individuals served or with the number of services rendered. In eight countries, a fee is paid for each act or service rendered.

For better understanding the organisation of health care systems and the differences in health care resources in the Member States, the EUCOMP project has been launched in the framework of the Health Monitoring Program co-ordinated by the North Eastern Health Board from Ireland with the support of Eurostat and all the Member States. The intention is to produce a result, which is capable of application in all Member States, with a template for a data collection and comparisons toolkit. The design of the questionnaire is characterised by the integration of the list of functions of health care from the Dutch CCP-project and the functional classification, established by the OECD within the framework of the development of a system of health accounts. As a spin-off to this activity definitions and descriptions will become available as basic material for the development of a glossary of the most important health care concepts.

Total health expenditure

According to OECD definition on health expenditure, the amount in 1997 that the EU countries spent on total health care as a share of their gross domestic product (GDP) in the Member States of the EU was between 6.7% and 10.4%. As can be seen, expenditure on health care accounts for a relatively large proportion of GDP in France (9.9%) and the Germany (10.4%) compared with Ireland (7.0%) or UK (6.7%). The proportion of GDP spent on health care increased between 1980-1997, with 12 Member States devoting an increasing proportion of GDP to health care. The variation of this proportion is caused by the combined

action of the underlying growth rates of GDP and total expenditures on health, respectively. Between 1980 and 1997, the average annual growth rate of the total health expenses exceeded the growth rate of GDP in almost the entire EU. The development of health expenditure as a proportion of GDP was not uniform over this period. In the majority of Member States, the average annual growth rate of this proportion was higher in the recession years 1990-1993, compared to the ten years before.

Expenditure depends partly on the price of the goods and services, and partly on the quantity supplied. Price inflation plays a large part in the growth of the nominal GDP and total health expenditures. The specific health care cost increases could be somewhat higher (or lower) than the general inflation. However, determination of the medical-specific inflation is difficult. The general problem with the health sector is that 'health' as an output cannot be measured directly. While in most economic sectors goods and prices are readily available, these cannot be recorded directly for e.g. ambulatory and hospital services. Besides (medical) price inflation, various other factors have contributed to the increase in medical expenditure - particularly the increased demand for health care by older populations with higher levels of disability and chronic diseases, the constant development of new and expensive medical techniques and the increased access to and utilisation of these techniques, together with increasing consumers' expectations of a healthy life.

It should be stressed again that differences in health care organisation and in the boundaries of health care, e.g. what is 'health' and what is 'social' services, make inter country comparisons difficult to interpret both at a given point in time and according to trends.

The increase in public expenditure on health care was generally lower than the increase in total expenditure between 1980 and 1997. In 1997, public expenditure accounted on average for three-quarters of total expenditure on health care. The change in total as well as public health care expenditure per head of population, between 1980 and 1995, in the Member States, is shown in a graph. These expenditure data have been calculated in national currency units at 1990 GDP relative prices, in order to remove the influence of the general inflation between 1985 and 1995. It should be noted that the resulting expenditure changes may be attributable to either 'price effects' of medical goods and services (because the prices of these health care expenditures may differ from the general consumer price index) or to 'volume effects'. Between 1980 and 1997, public expenditure on health care increased at a slower pace than total expenditure in all the countries apart from Belgium, the Netherlands and Finland. Total expenditure also includes the portion to be borne by the patients themselves, either directly or indirectly through private insurance schemes. So in the EU there was a part of the financing of health care shifting from public authorities to the households themselves.

The tables show the substantial differences between Member States in total health expenditure per head of population in 1997. Expressed in PPP (Purchasing Power Parities) which reflect the real purchasing power of a currency within the country concerned, Germany (2 364 PPP) and Luxembourg (2 303 PPP) spent almost 50% more per capita than the EU average (1 698 PPP) and over 2 or 1.5 times as Greece (1 196 PPP), Ireland (1 293 PPP), Spain (1 183 PPS) and Portugal (1 148 PPP). Similar trends are observed in the in-patient care expenditure per head of population and the ambulatory care expenditure per head of population. It is interesting to observe (even if the comparability of the data is weak) that in some countries (Spain, Luxembourg, Austria and Finland) expenditure on ambulatory care is becoming greater than on in-patient care.

The expenditure data are retrieved from the OECD Ecosanté database 1999. In its health accounts, the OECD looks at the financing aspect of health care in its entirety. *Total health expenditure* includes: the medical care households receive (ranging from hospitals and physicians to ambulance services and pharmaceutical products), and their health expenses, including cost-sharing and the medicines

they buy on their own initiative; government-supplied health services (e.g. schools, vaccination campaigns), investment in clinics, laboratories, etc.; administration costs; research and development; industrial medicine, outlays of voluntary organisations, caritative institutions and non-governmental health plans. *Public expenditure on health* is the publicly financed share (i.e. by the central and local authorities, public health centres and social insurance bodies) of the total expenditure on health, namely: direct outlays; reimbursements to households (transfers); payments to producers to lower costs (subsidies); direct investments and capital transfers to private investors; the public sector also lowers the household burden through tax deductions and tax credits.

The calculation of PPP (Purchasing Power Parities) is organised at world level by the International Comparison Project of the United Nations. The basis for the calculation of PPP is data on prices of an agreed list of products. Great attention is given to obtaining a list of products which are both representative in the countries participating and strictly comparable between countries. Price parities for the aggregates and for GDP are then obtained as suitably weighted averages of these price ratios. Such parities would be enough in order to express all the data, in real terms, in the currency of one country (the method guarantees that they are transitive and independent of the base country chosen). In the OECD database Ecosanté, PPPs are the rates of currency conversion that equalise the purchasing power of different currencies. This means that a given sum of money, when converted into different currencies at the PPPs rates, will constitute the same basket of goods and services in all countries. Unfortunately, price comparisons and PPP for health services and goods are among the weak points in international health care data sets. Health specific PPPs, and hence, the results presented here, should be used with caution.

Experts agree that all existing expenditure data have strengths and weaknesses. Bilateral or country-by-country comparisons based on a multi-axial breakdown of expenditure by providers, by functions, and by financing institutions is an innovative approach to increase comparability. OECD and Eurostat are currently implementing this approach in the framework of a new Handbook 'A System of Health Accounts for International Data Collection (OECD)'.

Medical care expenditure

According to the final consumption of households in PPS as expressed in the National Accounts (ESA), the medical care and health expenditure of households was 739 035 PPS as an EU 15 average for 1994. It represents a 30.0% increase in relation to 1985. The situation is varied throughout the EU with high household consumption of medical care in the Netherlands (1 245 834), Germany (1 240 343), France (1 042 021), Belgium (1 160 682) and Luxembourg (986 239), in contrast to the UK (151 556), Sweden (170 721), Denmark (204 386) and Ireland (278 285). The amount of household expenditure is probably related to the organisation of health care systems and the way it is financed in each Member State.

Similar patterns can be observed for household expenditure on therapeutic appliances and equipment, hospital care and the like, and the services of physicians, nurses and related practitioners.

Based on the European System of Integrated Economic Accounts (ESA), Eurostat produces figures for the final consumption of households, representing the value of goods and services used for the direct satisfaction of individual human needs. The flow contains the final consumption of resident households and non-resident households on the economic territory. It is valued at purchasers' prices

for products bought on the market and at basic prices for own consumption and for products received by employees from their employers as remuneration in kind. This does not apply to social transfers in kind, such as expenditure initially incurred by households but subsequently reimbursed by social security (e.g. some medical expenses).

The calculation of PPP (Purchasing Power Parities) is organised at world level by the International Comparison Project of the United Nations (*see point Total health expenditure*). For the EU calculations another 'numerator' is used. It is called the purchasing power standard (PPS) and is defined by applying these price ratios to the GDP in national currencies of the countries and scaling the parities such that the value of the GDP of EU 15 in PPS is the same as in ECU (or Euro). The identity EU total in ECU's = EU total in PPS used to define the 'numerator' is calculated for every year.

Pharmaceutical expenditure

The continuous rise in pharmaceutical costs has caused increased concern to Member States. According to OECD Health Data, the total expenditure on pharmaceutical goods in the EU represents between 10% and 20% of total health care expenditure, a figure that has been increasing more rapidly than total health expenditure during the 1980s and the beginning of the 1990s. This has reflected the introduction of expensive new medicines and increases in volume rather than a general increase in prices. A related factor is that the proportion of prescription costs paid for by publicly financed schemes has been increasing steadily.

Total Expenditure on Pharmaceutical Goods is retrieved from the OECD Ecosanté database 1999. The total expenditure on pharmaceutical goods is defined as the consumption of pharmaceutical products, including prescriptions and self-medication, often referred to as over-the-counter (OTC) products. Vitamins are excluded, as they are nutrients. The series includes the pharmacists' remuneration when it is separate from the price of the medicines. Pharmaceuticals consumed in hospitals are excluded. The expenditure includes VAT and sales taxes where applicable. The amount of consumption in hospitals is included under in-patient care.

The number of hospital stays, bed-days and surgical procedures declined most rapidly for those diagnoses with the greatest increase in the total number of drugs prescribed and the greatest change in the distribution of drugs, by molecule. Greater quantity and novelty of pharmaceuticals reduced the average length of stay in hospitals, as well as the number of hospital stays. The average number of in-patient procedures performed per stay increased more slowly for diagnoses with higher growth in drug quantity and novelty. Increases in drug quantity and novelty are associated with reductions in both the numbers of hospital deaths and deaths per hospital stay; they have much weaker effects on non-hospital mortality, and are unrelated to changes in mean age at death. The greater the increase in the probability that a doctor prescribes a drug, the lower the increase in the probability that he or she refers the patient to another physician. Changes in the number of ambulatory surgical procedures appear to be unrelated to changes in drug utilisation.

Final consumption of households on medical and pharmaceutical products per consumption function in PPS can be expressed in the ratio per inhabitant for different functions of consumption according to the results for 13 countries in the EU used in the National Accounts (ESA). France (299.3 PPS in 1995) has the largest consumption per capita of medicines and other pharmaceutical products in the EU, in contrast to the UK (44.3) after the beginning of 80s. Italy (238.8), Belgium (200.2) and the Netherlands (207.6) also have high

levels of medical consumption. Austria (78.5), Denmark (62.3) and Sweden (55.7) have low levels of consumption.

Health care expenditure in the social protection schemes

The data on social protection expenditure and receipts for the Member States of the EU, are drawn up by Eurostat according to the European system of integrated social protection statistics (ESSPROS). This harmonised system provides a means to analyse and to compare the relevant financial flows. Expenditure on social protection schemes is broken down into social benefits, administration costs, transfers to other schemes and other expenditure. Social benefits consists in transfers, in cash or in kind, by social protection schemes to households or individuals to relieve them of the burden of risks or needs. Social benefits are classified by function (from which the sickness/health care function), by whether or not they are subject to means-testing (i.e. whether the beneficiary's income and/or wealth falls below a specified level), by type: cash benefits (periodic and lump sum), benefits in kind and re-routed social contributions (payments made by one social protection scheme to another in order to maintain or accrue the rights of the people protected to social protection under the latter scheme).

In most Member States an average of 25% of total expenditure on social protection benefits is assigned to health. In 1997, each inhabitant received average annual sickness/health care benefits amounting to the equivalent of PPS 1 375. Five Member States exceeded this average, including Luxembourg (2 119) with a rate 50% above the average, the Netherlands (1 835), Germany (1 691), France (1 664) and Austria (1 554) with rates approximately 25% above the average. The southern EU countries, in particular Greece (708), Portugal (839) and Spain (927), recorded lower sickness benefit levels even if the increase since 1990 in Spain (67%), Greece (66%) and Portugal (44%) is important.

In the period 1980-97, the share of GDP devoted to social protection sickness/health care decreased in Denmark, Germany, Ireland, Austria and Sweden. Consequently, expenditure on health grew less rapidly than the gross domestic product and increased in the other countries. The trend is hardly surprising in Spain, Italy, Portugal and the UK, in view of the lower initial level of social protection expenditure on health and the gradual introduction of collective benefits in the southern EU countries (introduction of a national health system). In contrast, despite their efforts, France has not succeeded in controlling the growth of this expenditure, which has continued to increase not only in absolute terms, but also as a proportion of the national wealth.

A complete description of the health care provision in the social protection systems and, specially, the description of the out-pocket payments and the main cost sharing measures for medical treatment and hospital staying is provided by the MISSOC (Mutual Information System on Social Protection in the EU) created by the European Commission. This on-line system provides a permanent update of all modifications and changes in legal systems of medical reimbursements and health care provision in the EU countries. According to the MISSOC (see Annex III), the way in which health care systems are organised varies a lot in the MS. Data relating to in-patient and out-patient health care provision are broken down into directly provided benefits and reimbursements. Reimbursements (patient pays and social protection system reimburses) is predominant in France, Luxembourg and, partially, in Belgium. The direct system (benefits are directly provided to the protected people) is typical of national health services (Denmark, UK, Spain, Greece). The direct settlement system (*tiers payant*) with a variety of agreements with health care providers can be found in France, Germany, the Netherlands and Belgium. Various methods of cost sharing exist also in the MS (fixed percentage, threshold for costs, fixed fee, goods or services excluded, etc). They are described in Annex III.

The sickness/health care function in the ESSPROS (European System of Statistics on Social Protection) collected by Eurostat includes: cash benefits (rather limited because the most part are included in other social protection functions) that replaces whole or in part loss of earnings during temporary inability to work due to sickness and injury and medical care provided in the framework of social protection to maintain, restore or improve the health of the people protected. Medical care covers services (medical and paramedical services provided by general practitioners, specialists and other personnel; laboratory tests and other examinations; dental care; physiotherapy; thermal cures; transport of sick people; preventive treatment such as vaccinations; accommodation in the case of a stay in hospital or other institution) and goods (pharmaceutical products; medical prosthesis; dressing and medical supplies).

Research and development on human health

According to Eurostat data, the proportion of government R&D appropriations devoted to the protection and improvement of human health has grown by 59% in EU since 1986. The increase in human health R&D appropriations varies significantly between Member States.

According to Eurostat, government budget appropriations or outlays on Research and Development mean all appropriations by central government allocated to R&D in central government budgets. Data on government R&D appropriations therefore refer to budget provisions, not to actual expenditure. The figures for actual expenditure, which are not available in their final form until some time after the end of the budget year concerned, may well differ from the original budget provisions. Government R&D appropriations are broken down by socio-economic objectives on the basis of the NABS (Nomenclature for the Analysis and Comparison of Scientific Programmes and Budgets) developed by the European Commission.

(1) Specialist nursing staff and midwives. Calculated as man years.

(2) Krankenschwestern, Krankenpfleger und Hebammen (results Mikrozensus)

(3) Only nurses with diplomas of at least three years and midwives practising in public and private hospitals, 1995 and 1996 have been estimated.

(4) Figures for overseas departments not included since 1982

(5) Midwives included even if in France they are a medical profession

(6) Head accounting

(7) Active nurses

(8) INAMI for out-patient nurses and Ministère de la Santé for in-patient nurses. Nurses in 'Maison de repos, not included.

(1) Nursing homes and day care beds not included

(2) Nursing homes and day care beds partially included

(3) Beds in Military hospitals not included

(4) Only beds in public hospitals are included

(5) Until 1995 the number of hospital beds were collected separately. Since 1996 the number of hospital beds has been estimated following the formula the number of hospitalisations days/365 (or 366 in leap years). Estimated utilisation rate is 100%.

(6) After the ADEL-reform, around 31000 beds for somatic stay has been transferred to the city councils since 1.1.1992 and not more included in the health statistics.

6.4.3

Change (1980-1995) in total and public health expenditure on national currency units at 1990 GDP relative prices

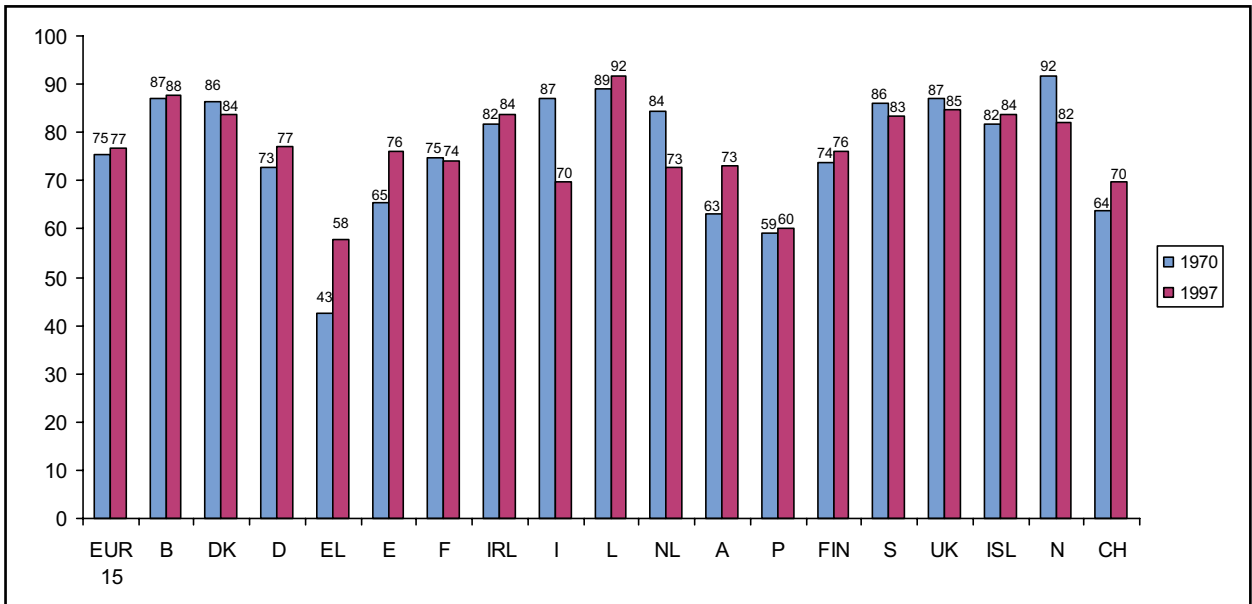

Value of the price index of the variable considered divided by the value of the price index of GDP, calculated as 1990=100. This is an indicator of the variation in the prices of the variable considered, compared to the variation of total production prices.

ANNEXE **7**

I. Organisation of the health systems

	Main type of coverage	Share (%) in financing health system 1992				Methods of providing services under health insurance		Main type of providers primary care doctors	Type of payment to
		Social contributions	State	Per-sons	Private insurances	Integrated	Contracted		
A	social insurance	54.3	24.0	13.9	5.1	-	All services	ambulatory mainly private; hospitals mainly public	fee-for-service (R) plus capitation (1)
B	social insurance + government subsidies	44.0	34.1	12.0	5.3	-	All services	ambulatory private; hospitals partly public	fee-for-service
D	social insurance	67.7	11.3	12.0	7.9	-	All services	ambulatory private; hospitals partly public	normally fee-for-service (R)
DK	national health service	0.0	86.1	12.1	1.8	Hospitals	GPs, specialists outside hospitals, pharmacies	mainly public	28% capitation, 63% fee-for-service, 9% other (R) (2)
E	mixed system: national health service + contributions	32.7	47.0	15.5	4.8	Specialists, hospitals, GPs	Pharmacies, dentists and private hospitals	mainly public	60% GPs salary plus capitation, 40% GPs capitation (R)
F	social insurance	66.2	6.2	17.8	9.0	-	All services	ambulatory private; hospitals mainly public	fee-for-service
FIN	national health service	:	:	:	:	Hospitals, health centres	Private hospitals, pharmacies, private outpatient care services	mainly public	salary, some capitation (R)
GR	mixed system: national health service + contributions	44.4	33.5	19.1	3.0	Doctors, dentists, hospitals	Private hospitals and pharmacies	mainly public	salary (R)
I	mixed system: national health service + contributions	36.4	39.0	20.2	2.3	Public hospitals and specialists	Private hospitals, GPs and private specialists	mainly public	capitation (R)

IRL	publicly financed health system	5.7	72.0	13.7	8.4	Public hospitals, specialists	Private non-profit hospitals, GPs, pharmacies	mainly private	fee-for-service if higher income, capitation if lower income (R)
L	social insurance	52.1	27.3	17.7	2.8	-	All services	mainly private	fee-for-service
NL	social insurance	72.1	4.9	8.1	14.9	-	All services	mainly private	fee-for-service if higher income, capitation if lower income ^(R)
P	national health service	13.7	61.6	21.9	2.2	GPs, some specialists, public hospitals	Private hospitals, some doctors in rural areas, pharmacies, labs for X-rays and pathology	mainly public	salary (R)
S	national health service	11.0	76.7	11.1	1.2	Hospitals, health centres, pharmacies	Private doctors, private hospitals (1% of beds)	mainly public	salary (R), private doctors on fee-for-service
UK	national health service	7.0	71.8	15.8	5.4	Public hospitals, community services	GPs, private hospitals, most dentists	mainly public	capitation (R) (3)
CH	social insurance + government subsidies	31.3	32.2	24.5	9.5	-	All services	ambulatory private; hospitals partly public	Fee-for-service

(R) Access to a specialist is normally by referral from a General Practitioner.

(1) This may be reduced if doctor has many patients

(2) Also private doctors on fee-for-service with rights to extra-bill

(3) There also components of salary, some fees-for-services and bonuses for achieving certain preventive targets.

II. Overview of the home-care systems (Home nursing and home help services)

	Main providers	Provision of services	Medical referral required (for home nursing)	Assessment of needs	Funding of organisation	Co-payments by patients
A	Different organisations, varying between provinces. Mainly private non-profit organisations	Home nursing: Grundpflege (helping the patient with basic needs including ADL activities), Medizinischer Hauskrankenpflege (Technical nursing procedures) and basic care like washing and dressing Home help: temporary care for families or individuals at home	Yes, for technical home nursing care only	Home nursing: By qualified nurse using a standardised form Home help: By a qualified nurse of a special government agency, with standardised form	Home nursing: Fee-for-service: payment for nursing activity Home help: subsidised by province and municipalities and payment per hour	Home nursing: Yes, for general basic nursing care Home help: Yes, depending on income. Average % of total costs: 13%
B	Home nursing: One nation-wide private non-profit organisation (White/Yellow Cross), some smaller organisations and a large number of independent nurses Home help: Social services of municipality and some private organisations	Home nursing: hygiene and other personal care, routine technical nursing procedures, more complicated nursing activities, patient education and encouragement of informal care Home help: housework, hygienic and other personal care, moral support, general and family support. 11 hours help per week per family (average) spread over two days	Yes, for technical nursing care such as injections	By home nurse, social worker or social nurse using a national standardised form (Katz-schaal)	Home nursing: Fee-for-service: per diem, or per activity determined by level of dependency of patient Home help: Subsidised by central government based on number of personal and clients	Home nursing: Yes, mainly membership fee Home help: Yes depending on income and household composition Average % of total costs: 20%
DK	Home care department of municipalities	Home nursing: (not available) Home care: housework, hygienic and other personal care, shopping and outdoor walks	No	By social counsellor or nurse. No standardised assessment forms	Fixed budget funded by national and local taxes	No, except in some very specified cases in home nursing Average % of total costs: 0

FIN	<p>Home nursing: Local health (and social) care centres (NHS)</p> <p>Home help: Local health (and social) care centres (NHS), social welfare board of municipality and private non-profit organisations</p>	<p>Home nursing: medical and nursing care at the patient's own home, assist with all activities of daily living and co-ordinate the care of patient with home help services to keep the patient living home as long as possible</p> <p>Home help: housework, hygienic and other personal care, moral support</p>	<p>yes</p>	<p>Home nursing: By physician, health visitor or registered nurse. Standardised forms are used</p> <p>Home help: By leading home maker or social worker (social welfare) or health visitor or registered nurse (health and social centres). Standardised forms are used</p>	<p>Budget determined by local authorities</p>	<p>Yes, income and household-related.</p> <p>Average % of total costs: 11-35%</p>
F	<p>Mainly private non-profit organisations, some services by municipalities and large number of independent nurses</p>	<p>Home nursing: hygienic and other personal care, psychosocial activities and encouraging help from family members and other carers</p> <p>Home help: housework, hygienic care (in certain cases)</p>	<p>Yes</p>	<p>Home nursing: By nurse using standardised forms</p> <p>Home help: By social worker</p>	<p>Home nursing: Fee-for-service (payment for activity) and budget for a fixed number of patients</p> <p>Home help: Funding by municipality (low-income group) or private insurance.</p>	<p>Home nursing: Yes, but mostly paid by additional insurance</p> <p>Home help: Not below a certain income. Otherwise dependent on old age insurance</p> <p>Average % of total costs: 0</p>
D	<p>Home nursing: Mainly private non-profit organisations. In some regions mainly for-profit organisations.</p> <p>Home help: Mainly private non-profit organisations. Different organisations for services in addition to home nursing (Sozialstationen) and for home help for elderly (MSDs)</p>	<p>Home nursing: Grundpflege (helping the patient with basic needs including ADL activities), Behandlungspflege (Technical nursing procedures).</p> <p>Home help: temporary care for families or individuals at home including basic nursing care, pedagogical and psychological care and homemaking services</p>	<p>Yes</p>	<p>Home nursing: By physicians in co-operation with head nurse, using standardised forms.</p> <p>Home help: Mostly by a nurse or social worker, using standardised forms.</p>	<p>Home nursing: Fee-for-service</p> <p>Home help: Fee-for-service (by patient or insurance). For MSDs a global budget form municipalities is added, based on number of personnel and output</p>	<p>Home nursing: No</p> <p>Home help: Yes, except for home help in addition to home nursing</p> <p>Average % of total costs: 10% (Sozialstationen), 20% (other)</p>

EL	<p>Home nursing: NHS-Organisations, private organisations (both for-profit and non-profit)</p> <p>Home help: Private organisations (both for-profit and non-profit)</p>	<p>Home nursing: needs assessment, routine technical nursing procedures, more complicated nursing activities, patient education, psychosocial activities and evaluation of care</p> <p>Home help: housework, hygienic and other personal care, routine technical nursing procedures, moral support</p>	No	<p>Home nursing: By physician, health visitor, health nurse, or home help</p> <p>Home help: By visiting nurse or social worker.</p> <p>No national standardised forms</p>	<p>Home nursing: NHS and Red Cross organisations: fixed budget; others: fee-for-service</p> <p>Home help: Fee-for-service. No funding by authorities or insurances</p>	<p>Home nursing: Yes, for all services</p> <p>Home help: Yes, in private for-profit organisations only.</p> <p>Average % of total costs: 20%</p>
IRL	<p>Home nursing: Only statutory Health boards</p> <p>Home help: Health boards and some voluntary organisations</p>	<p>Home nursing: hygienic and other personal care, needs assessment, routine technical nursing procedures, more complicated nursing activities, patient education, psychosocial activities and stimulating informal care</p> <p>Home help: basic personal care, moral support, administrative duties and monitoring home help standards</p>	No	<p>By public health nurse or home help organiser. No national standardised forms</p>	<p>Fixed budget</p>	<p>Home nursing: No</p> <p>Home help: Yes, but different regulations in health boards.</p> <p>Average % of total costs: 10%</p>
I	<p>Home nursing: Different organisations: NHS, social services of municipalities, private organisations (for- and non-profit)</p> <p>Home help: Social services of municipalities and private organisations (for- and non-profit)</p>	<p>Home nursing: minimal amount of care per year is determined by law (140 hours of homemaking activities and personal care, 100 hours of nursing care, 50 house calls by the GP, 50 hours of rehabilitation care and 8 medical controls).</p> <p>Home help: housework, hygienic and personal care, moral support, general and family support</p>	No	<p>Home nursing: Nurse, physician or special team. No national standardised forms.</p> <p>Home help: Large differences between organisations. No national standardised forms</p>	<p>Public organisations: fixed budgets. Private organisations: fee-for-service</p>	<p>Home nursing: Yes, in social services and private organisations. Not in NHS</p> <p>Home help: Yes, but large differences between organisations</p> <p>Average % of total costs: 50%</p>

L	<p>Home nursing: Two large private non-profit organisations and four smaller ones (two non-profit)</p> <p>Home help: Mainly private non-profit organisations</p>	<p>Home nursing: the majority are prescribed services (hygienic and other personal care, needs assessment, routine technical nursing procedures, more complicated nursing activities, patient education, psychosocial activities)</p> <p>Home help: housework, hygienic and personal care, moral support, administrative duties</p>	<p>Yes, for technical nursing activities only</p>	<p>Home nursing: Physicians or specialised nurse. A special form can be used.</p> <p>Home help: By head of regional service: social worker or specialised nurse</p>	<p>"Home nursing: Mainly Fee-for-service; the four smaller ones also receive an additional state budget"</p> <p>Home help: Mainly budgets financed by Ministry of Health and municipalities</p>	<p>Home nursing: Yes, for general basic nursing care</p> <p>Home help: Yes, income related</p> <p>Average % of total costs: 30%</p>
NL	<p>The National Association of Home Care which consists of Regional Cross Associations or Home Care Organisations (all are private non-profit)</p>	<p>Home nursing: needs assessment, hygienic and other personal care, routine technical nursing procedures, more complicated nursing activities, patient education, psychosocial activities, encouraging help and evaluation of care</p>	<p>No</p>	<p>"Home care nurse (in Regional Cross Associations); nurse, home help manager or special team (in home care organisations). No national standardised forms"</p>	<p>Home nursing: Fixed budget based on the number of personal</p> <p>Home help: Fixed budget from central Government based on number of inhabitants and age distribution in catchment area</p>	<p>Home nursing: No</p> <p>Home help: Yes, dependent on income and household composition</p> <p>Average % of total costs: 10%</p>
P	<p>Home nursing: Mainly NHS-health care centres and some private non profit organisations</p> <p>Home help: Social services of municipalities and some private non-profit social solidarity organisations</p>	<p>Home help: housework, hygienic and personal care, moral support, psychosocial support</p> <p>Home nursing: routine technical nursing procedures, patient education, psychosocial care and stimulating informal care</p> <p>Home help: housework, hygienic and other personal care, family support</p>	<p>No</p>	<p>Home nursing: Nurse or physician. No standardised forms</p> <p>Home help: Social worker. No standardised forms.</p>	<p>Home nursing: Fixed budget based on historical costs with adjustments for inflation</p> <p>Home help: Fixed budget from central government, based on number of clients and types of services</p>	<p>Home nursing: No</p> <p>Home help: Yes, income related</p>

E	Home nursing: NHS-Health care centres Home help: Social services of municipalities	Home nursing: needs assessment, hygienic and other personal care, routine technical nursing procedures, more complicated nursing activities, patient education, psychosocial activities, encouraging help and evaluation of care Home help: housework, hygienic and other personal care, family support	No	Home nursing: Nurse or physician using a standardised form. Home help: Social worker. In some parts of the country a standardised form are used.	Home nursing: Fixed budget Home help: Fixed budget from municipalities and central government	Home nursing: No Home help: Yes, income related Average % of total costs: 10%
S	NHS-health care centres or social services of municipalities	Home nursing: needs assessment, hygienic and other personal care, routine technical nursing procedures, more complicated nursing activities, patient education, psychosocial activities, encouraging help and evaluation of care Home help: housework, hygienic and other personal care, routine technical nursing procedures	No, only in a few regions	Home nursing: Registered nurse (in health care centres). Home help: administrator (in social services). No standardised forms. Home help: Fixed budget from municipalities and central government	Home nursing: Fixed budget Home help: Fixed budget from municipalities and central government	Home nursing: Yes Home help: Yes, dependent on income and number of hours of care
UK	Home nursing: Part of NHS: community unit of DHAs or independent Community Trusts (after reform of NHS) Home help: Social services of municipalities and private organisations. both for- and non-profit	Home nursing: needs assessment, hygienic and other personal care, routine technical nursing procedures, more complicated nursing activities, patient education, psychosocial activities, encouraging help and evaluation of care Home help: housework, hygienic and other personal care, general and family support	No	Home nursing: By the team leader (a qualified nurse). No national standardised forms Home help: Care manager (social worker). No national standardised forms.	Home nursing: Old system: fixed budget based on number of inhabitants and demography of population. New system: fee-for-service. Home help: Social service: budgets. Private organisations: fee-for-service.	Home nursing: No Home help: Yes, different regulations exist. Average % of total costs: 20%

III. Description of out-of-pocket payments main cost sharing measure for medical treatment and hospital staying (I) 1999

	Approval of medical treatment	Professional fees	Patient's participation	Hospital stays
NL	All doctors qualified to practise with whom a health insurance fund has entered into a contract	<p>Direct payment of fees by the sickness fund: Flat-rate per insured person according to the system of lists (family doctor principle).</p> <p>Free choice of doctor (twice a year) by registering with a doctor who has entered into contract with a health insurance fund.</p>	<p>Health Insurance Act (ZFW): The 1997 introduced system of a general share borne with a maximum of NLG 200 (EUR 91) per year has been abolished as of 1st of January 1999.</p> <p>Exceptional Medical Expenses Act (AWBZ): A share must be borne by insured persons over 18, for nursing home care with a maximum of NLG 3,520 (EUR 1,597) per month.</p>	<p>Free choice among hospitals or institutions approved by the Minister of Health.</p> <p>No share borne by the beneficiary in the lower class of accommodation. Admission must be authorised by the health insurance fund.</p> <p>Duration of benefit: as long as indicated (after a year taken over by cover under the Exceptional Medical Expenses Act, AWBZ).</p>

D	<p>Contract doctors are formed into associations of sickness fund doctors (Kassenärztliche Vereinigungen) at regional and national level. In certain cases, hospital doctors who have completed a course of further training, doctors in hospitals and rehabilitation institutions, in special cases doctor-run institutions.</p>	<p>System based in principle on benefits in kind. No fees paid by insured; fees are paid by the association of sickness fund doctors (Kassenärztliche Vereinigung). The remuneration can be a fixed amount or can be calculated based on the criteria of either individual services provided, or of a flat rate per head, or according to a system resulting from a combination of these or further methods of calculation.</p> <p>The association of sickness fund doctors (Kassenärztliche Vereinigung) distributes the remuneration package among the contract doctors on the basis of a certain scale (payment distribution scale).</p> <p>Free choice among contracted sickness insurance fund doctors.</p> <p>Voluntary insured patients can choose cost repayment instead of benefits in kind.</p>	<p>No participation in the case of treatment by contracted doctors, except in the case of treatment (e.g. massages, baths or physiotherapy) which is also part of the prescribed cure, 15% has to be paid by the patient, except for children or hardship cases.</p>	<p>Free hospitalisation in a shared room with exception of participation of DEM 17 (EUR 8.69) (old Länder) or DEM 14 (EUR 7.16) (new Länder) per calendar day during a maximum of 14 days.</p> <p><i>Duration of benefit:</i> Unlimited, in principle.</p>
E	<p>Public Health Services (Servicios Públicos de Salud) appoint doctors to vacancies on the basis of competitive examinations.</p>	<p>General practitioners and specialists working outside hospitals are, in general, paid on the basis of lump sum determined by the number of insured persons entered on their list, thereby guaranteeing a minimum level of earnings.</p> <p>Hospital doctors are, in general, paid on the basis of a monthly salary plus certain supplementary payments.</p> <p>Free choice of general practitioner, paediatrician and obstetrician within area, provided choice would not bring number on doctor's list above maximum permitted.</p> <p>No fees are due</p>	<p>No participation</p>	<p><i>Surgery:</i> entirely free of charge. For other reasons: Authorised by administering body either automatically or on medical application where necessitated by diagnosis or patient suffering from a communicable disease or conduct or behaviour of the patient is such as to require constant attention.</p>

F	All doctors qualified to practise	Scales of fees fixed by a national agreement or by interministerial decree. These scales may be exceeded: For agreed physicians working in the so-called free fee sector, or having acquired a special qualification before 1980. Free choice of doctor. Advance on fees by insured person. Refund based upon agreed or official rate.	Share borne by insured person (statutory): 30% for doctors' fees, 25% for consultations given in hospitals, 20% for hospital treatment. Not required for certain complaints and for those complaints only.	Free choice among public and private (approved) hospitals. Participation of the insured: 20% in general. No participation from 31st day of hospitalisation for treatment or series of treatments above K 50 (scale of sicknesses). Participation for hospitalisation: FRF 70 (EUR 11) per day, including the day of discharge. Duration of coverage: Unlimited, subject to sickness fund's prior approval.
DK	All doctors qualified to practise (numbers limited by district according to number of inhabitants). Category 1: Free choice of doctor (once in a period of 6 months) registered with the district. No fees payable for care given by the chosen doctor. Category 2: Free choice, but the insured person has to pay part of the costs.	Fees are fixed by agreement between the Doctors' Organisation and the public health insurance. Fees are calculated according to the number of patients registered and of the medical services performed. Specialists are paid a flat-rate sum for each medical action. Category 1: Free choice of doctor (once in a period of 6 months) registered with the district. No fees payable for care given by the chosen doctor. Category 2: Free choice, but the insured person has to pay part of the costs.	Category 1: No charges. (Treatment by the chosen GP or a specialist to whom he refers the patient.) Category 2: The part of expenses which exceeds the amount fixed by the public scheme for Category 1.	Free choice of regional public hospitals. Public hospitals and approved private establishments: No charge. Non-approved private establishments: patients pay all costs. In the case where a public hospital refers a patient to a private establishment: no charge.

EL	Doctors employed by the insurance institute (IKA).	<p>Doctors are paid by the insurance institution.</p> <p>There is no option for the doctor's choice. The insured goes to the local insurance institute doctor.</p> <p>No fees.</p>	No participation.	<p>The insured has the right to hospitalisation in a public hospital or in a registered clinic designated by the insurance institute or in an IKA hospital.</p> <p>No charge, in case of hospitalisation, for the insured.</p>
L	All doctors qualified to practise.	<p>Fees according to collective agreements. Scales of fees are linked to the trend of reasonable compensation of employees. Payment for treatment. Free choice of doctor for each complaint, treatment abroad subject to approval of sickness fund.</p>	<p>Share borne by insured person: 20 % of the ordinary tariff for visits for the first medical visit in any 28-day period; 5 % for other visits or consultations.</p> <p>No charge in cases of hospitalisation.</p> <p>No restriction for seeing a specialist.</p>	<p>Free choice of hospital (hospital abroad subject to approval of sickness fund).</p> <p><i>Participation in maintenance costs:</i> LUF 219 (EUR 5.43) per day of hospitalisation.</p>

<p>IRL</p>	<p>Doctors participate in the general medical services on the basis of a contract agreed by the Department of Health with the Irish Medical Organisation.</p>	<p>Doctors are paid an annual capitation fee per eligible patient in accordance with a scale of fees agreed with the Irish Medical Organisation.</p> <p>Persons with full eligibility may choose from a list of local doctors. Doctor's fees are paid by the local Health Board. See "Organisation: 1 Doctors - Payment".</p> <p>Persons with limited eligibility choose their own doctor and pay fees directly to doctor.</p>	<p>Persons with full eligibility enjoy a full range of general practitioner services, including related prescribed drugs, at no cost. There is also a range of schemes, particularly with respect to prescribed drugs, intended to assist persons not eligible for medical card.</p> <p>Persons with limited eligibility can avail of specialist services in public hospitals free of charge.</p>	<p>Persons with full eligibility: No charge.</p> <p>Persons with limited eligibility: Charge of IEP 25 (EUR 32) per night in a public ward up to a maximum of IEP 250 (EUR 317) on any 12 month consecutive period.</p> <p>Persons who attend the Accident and Emergency Department directly without having a letter of referral from their general practitioner are liable for a charge of IEP 20 (EUR 25) which applies to the first visit for any episode of care only. No charge applies to attendances at out-patient clinics.</p> <p>Private hospitals and homes: Patient is liable for all costs except that in some nursing homes financial aid is given towards the cost of maintenance.</p> <p>Infectious diseases treatment: Free of charge to all persons. Unlimited duration.</p>
-------------------	---	--	---	--

I	<p>Doctors employed either by the regional health administrations, or by the hospitals. General practitioners and specialists approved under special contracts.</p>	<p><i>Employed doctors:</i> Variable monthly wages, determined by the government according to professional categories.</p> <p><i>Approved doctors:</i> Flat-rate amount per capita. Free choice of general practitioner among those approved for the region. The choice is confirmed unless the insured decides otherwise. There is no payment made by the insured person for treatment but the doctor receives from the region a flat-rate lump sum per insured person.</p> <p>For specialists a prescription made out by a general practitioner is needed and only specialists who work at the health centres (USL) are covered for.</p>	<p><i>Tests, visits to a specialist and medication of group B are free of charge for:</i> children up to 6 years, persons aged over 65 if they come from a family whose income is below ITL 70,000,000 (EUR 36,152); recipients of minimal pensions aged over 60 and unemployed persons with an annual family income of less than ITL 16,000,000 (EUR 8,263); this limit amounts to ITL 22,000,000 (EUR 11,362) for a couple and is increased by ITL 1,000,000 (EUR 516) for each dependent child; recipients of social pensions; those with serious complaints of for patients waiting for a transplantation.</p> <p>Other insured persons pay up to ITL 70,000 (EUR 36) for each prescription.</p> <p>In the case of pregnancy all tests are free of charge if carried out within the framework of the public health service.</p> <p>For each test carried out or each visit to a specialist the insured person is expected to contribute ITL 6,000 (EUR 3.10). If more than one service rendered in the same specialised field, the insured person contributes 50% of the costs, with a ceiling of ITL 70,000 (EUR 36).</p>	<p>Free choice of public or private hospital among those registered under the scheme. Direct assistance free (sharing a room).</p>
---	---	--	--	--

<p>A</p>	<p>The relationship between medical doctors and insurance funds is governed by individual contracts, the contents of which are determined to a far-reaching extent by overall contracts with the Regional Chambers of Medical Doctors (Ärzttekammer).</p>	<p>Fees are laid down in the overall contracts between the Regional Chambers of Medical Doctors and the insurance funds (flat-rate per person, per sick case or per medical treatment or a combination of all).</p> <p>Free choice of doctors who have concluded an individual contract (Vertragsärzte).</p> <p>No fees paid by the insured person, the payment is made by the insurance fund.</p>	<p>As of 1. 1. 1997 patients will pay a contribution amounting to ATS 50 (EUR 3.63) on each certificate for treatment by a doctor or a dentist (except in the case of children, pensioners and the needy).</p>	<p>Full coverage of expenses in the general scale of fees of a public or private hospital (which has concluded a contract), with the exception of a minor participation of an amount of max. ATS 72 (EUR 5.23) per day which can only be claimed for a maximum of 28 days per calendar year.</p> <p>For the hospitalisation of a dependant a 10%-contribution for a period of 4 weeks.</p> <p>Duration of benefit: as long as required.</p>
<p>P</p>	<p>Doctors employed either by regional health authorities or by hospitals. Specialists approved under agreement between the Order of Medical Practitioners and the Ministry of Health for the purpose of consultations for persons unable to reach an official clinic within a specified time.</p>	<p><i>Employed doctors</i>: monthly salary set by government, varying according to professional category.</p> <p><i>Approved doctors</i>: payment per item of service.</p> <p>Free choice of general practitioner/specialist working either in health centres or under agreement.</p> <p>No fees to be paid (National Health Service).</p>	<p>Variable insured person's share set by government. Exemption for some specific groups, e.g. pregnant women, children under 12 years, pensioners with income below the national minimum wage, persons responsible for certain handicapped young people, the socially and economically disadvantaged.</p>	<p>Free choice among public hospitals and, if there is a waiting list, institutions approved by the Ministry of Health. No participation in charges in public ward (or in private room if recommended by the doctor). If in private room freely chosen by beneficiaries, charges are payable in full by the beneficiaries, as well as private hospital and clinic charges.</p>

FIN	All doctors must be approved by the National Board of Medicolegal Affairs.	<p>Doctors working at public hospitals or health centres are salaried by municipalities.</p> <p>Private doctors are paid on a fee-for-service basis.</p> <p><i>Public Hospital and Health Centre:</i> Only limited possibility of choice. Doctors are employed by the municipality. Patients' fees see point 2.</p> <p><i>Private doctor:</i> Free choice and the patient pays the doctor directly in full.</p>	<p><i>Health Centre:</i> Physician services maximum FIM 50 (EUR 8.41) for the first three visits in a calendar year or an annual fee of maximum FIM 100 (EUR 17) for 12 months depending on the municipality; most other services free of charge. Children under the age of 15 are exempt from the fee.</p> <p><i>Hospital:</i> The fee for an out-patient visit is FIM 100 (EUR 17), for day surgery FIM 250 (EUR 42). The fee for in-patient care is FIM 125 (EUR 21) a day. The fee for in-patient care in psychiatric units is FIM 70 (EUR 12).</p> <p><i>Private doctor:</i> The patient pays doctor's basic fee which, as far as it does not exceed a fixed tariff, is refunded by 60% from the sickness insurance. For treatment costs on prescription by certain other medical staff, the patient's own liability is FIM 70 (EUR 12) and 25% of the excess amount within a fixed tariff.</p>	<p><i>Public hospital:</i> Hospital fee of FIM 125 (EUR 21) a day. Patient under the age of 18 may be charged only for the first seven treatment days in a calendar year. Patient receiving long-term care (over three months) are charged a fee in accordance with their means. Such a fee, however, may be no more than 80% of the patient's net monthly income.</p> <p><i>Private hospital:</i> Part of the doctor's fee and costs for examination and care are refunded by the sickness insurance.</p>
S	All doctors qualified to practise are able to be affiliated to the sickness insurance (<i>sjuk- och föräldraförsäkring</i>).	<p>Doctors employed by the public health authorities are paid an income.</p> <p>Private practitioners affiliated to a county council paid according to a tax, which is fixed after negotiations between the government and the doctors' organisations.</p> <p>Free choice of doctors in the public health and private practitioners affiliated to a county council.</p> <p>The patient pays a part of the cost himself. The doctor, if it is a private practitioner, will be paid the rest from the regional health authorities.</p>	<p>The insured person pays between SEK 100 (EUR 11) and SEK 140 (EUR 15) per visit to a doctor.</p> <p>For specialist care the patient pays between SEK 120 (EUR 13) and SEK 250 (EUR 26).</p> <p>Emergency cases: between SEK 120 (EUR 13) and SEK 300 (EUR 32). Below the age of 20 no charge.</p>	<p>Free choice of regional public hospitals and approved private establishments.</p> <p>The patient will be charged maximum SEK 80 (EUR 8.45) per 24 hours.</p>

<p>UK</p>	<p>Doctors licensed to practice by the General Medical Council (the statutory licensing body) contract with Local Health Authorities, subject to approval of Medical Practices Committee (which regulates the numbers of doctors in each locality).</p>	<p>Fees, allowances and reimbursements set nationally by Government, in the light of recommendations by an independent Pay Review Body and after consultation with doctors' representatives (National Health Service).</p> <p>From April 1998 alternative arrangements based on direct negotiations between individual doctors and Health Authorities are being piloted.</p> <p>Free choice by patient (or parent/guardian), subject to acceptance by doctor. If a patient cannot find a doctor willing to accept them, the Health Authority will assign a patient to a doctor's list.</p> <p>No fees for services provided by National Health Service.</p>	<p>No charge.</p>	<p>No charge, except where the patient asks for special amenities or for extra treatment which is clinically necessary.</p>
------------------	---	---	-------------------	---

Description of out-of-pocket payments main cost sharing measure for other provisions on health care (II) 1999

	Pharmaceutical products	Prostheses, Spectacles and hearing aids	Dental services	Transport of patients	Courses of treatment	Others
NL	<p>Registration of insured person with a chemist who entered into contract with the health insured fund</p> <p>Insured person is entitled to a qualitatively good package of medicines without it being necessary to make additional payment. Besides this medical package medicines can be supplied and charged to the health insurance funds up to the average price per standard dosage of medicines which belong to a certain classified medical package, with an additional payment to be paid by the insured himself</p>	<p>Subject to prior approval of health insurer. No cost sharing except for:</p> <p><i>Artificial breasts</i>: payment of cost in excess of maximum NLG 397.50 (EUR 180).</p> <p><i>Orthopaedic shoes</i>: share in cost of NLG 112 (EUR 51) per year up to age 16; NLG 224 per year (EUR 102) for age 16 and over.</p> <p><i>Spectacles and contact lenses</i>: after first purchase entitlement without cost-sharing only on specific medical indication.</p> <p><i>Hearing appliances</i>: payment of cost in excess of NLG 1,273.50 (EUR 578).</p> <p><i>Wigs</i>: payment of cost in excess of NLG 556 (EUR 252).</p>	<p>Comprising dental care for children including preventive maintenance work, fluoride applications up to twice a year from the age of six, sealing, periodontal care and surgical treatment.</p> <p>Comprising for adults preventive dental care (check up at least one a year), dentures and specialist surgical treatment.</p> <p><i>Dentures</i>: Patient's participation of 25%.</p>	<p>By ambulance, taxi or private car: share in the cost of 66 Euro per 12 months</p>	<p>No benefits</p>	<p><i>Physiotherapy</i>: entitlement of 9 treatments per indication per year</p>

<p>F</p>	<p>Insured person's share: 35% or 65% for drugs mainly meant for troubles or affections normally without gravity. 100% for ease drugs. No share required from long-term patient, only for the illness concerned.</p>	<p>Subject to sickness fund's prior approval: refund of established fees (65 %) and for major fittings (100 %).</p>	<p>Comprising preventive and conservative treatment, extractions and (submit to approval) dental prosthesis, orthodontic treatment. Refund: according to fixed rate as for medical care. Share borne by the insured person: 30%.</p>	<p>Transportation in case of hospitalisation.</p>	<p>Subject to sickness fund's prior approval: refund of medical fees and cost of treatment in a thermal centre. No daily allowances in principle (except for social and medical treatment provided by the sickness fund).</p>	<p>Supplementary benefits and aid benefits which may be granted by the sickness insurance fund for social and medical treatment.</p>
-----------------	--	---	--	---	---	--

<p>D</p> <p><i>Insured person's contribution:</i> A charge of DEM 8 (EUR 4.09), DEM 9 (EUR 4.60), DEM 10 (EUR 5.11), depending on the packet</p> <p>size of the pharmaceutical product prescribed, except for children and hardship cases. If there is a fixed-price for a group of products</p> <p>(Festbetragsarzneimittel), the amount of contribution payable depends on this fixed price. In such cases, the patient must pay the difference between the fixed price and the prescribed product, in addition to the set prescription charge.</p> <p>Insured persons must pay for comfort drugs (Bagatellarzneimittel). Certain uneconomical drugs are not paid by the insurance.</p> <p><i>Members of family:</i> As for insured persons.</p>	<p>As long as no fixed amounts are established, the sickness funds cover the entire costs, when fixed amounts have been established, the costs will be covered up to this amount.</p> <p><i>For bandages, insoles, and aids for compression therapy:</i> 20% of the amount to be covered by the sickness funds, with the exception of children and hardship cases. Payment of costs for a spectacle frame by the insured.</p>	<p>A system encompassing all age groups of prophylactic measures designed to prevent dental disease.</p> <p>Full compensation of conservative dental treatment, including dental prophylactics.</p> <p><i>For denture, the insured person contributes 50% of the costs of the required medical treatment. When the insured person takes measures to maintain healthy teeth, the benefit is increased by a bonus of 10% or 15%.</i></p>	<p>In certain cases the cost for rescue and transport back to the hospital or the doctor are covered; DEM 25 (EUR 13) participation per journey.</p>	<p>Payment of medical services for ambulatory preventive or rehabilitative courses; contribution to the other costs (accommodation, nursing, transportation) up to DEM 15 (EUR 7.67) per day. Full compensation with DEM 25 (EUR 13) (old Länder) and DEM 20 (EUR 10) (new Länder) paid by the insured patient per (calendar) day or contribution of sickness funds for preventive and curative courses for mothers. Full compensation for institutional preventive or rehabilitative courses, except for copayment of insured person of DEM 25 (EUR 13) (old Länder) and DEM 20 (EUR 10) (new Länder) per day.</p>	<p><i>Home care:</i> Basic nursing and treatment as well as household assistance.</p> <p><i>Household aid,</i> i.e. replacement in the household, or payment of cost of household assistant.</p> <p>Examination of children for early discovery of diseases.</p> <p>Medical examination of insured persons after the age of 35 for early discovery of heart-, circulation- or kidney diseases and of diabetes.</p> <p>Examinations for early discovery of cancer.</p> <p>Prescribed items other than medicines: insured person pays 15%, except for children and hardship cases.</p> <p><i>Long-term Care Insurance:</i> Benefits for persons permanently and to a large extent in need of help because of a physical illness or a mental disease or due to any other handicap. Domiciliary care: Basic nursing and household assistance by non-residential care institutions up to the amount of DEM 750 (EUR 383), DEM 1,800 (EUR 920) or DEM 2,800 (EUR 1,432) per month, depending on the nursing level; in special hardship cases up to DEM 3,750 (EUR 1,917) p.m. Care allowance: Instead of availing of the help of professional care services, the person in need of care may apply for a nursing allowance, if he/she personally ensures that the necessary basic care and assistance is provided by a carer; depending on the care level, the rate of the allowance is equal to DEM 400 (EUR 205), DEM 800 (EUR 409) or DEM 1,300 (EUR 665) per month. Combined benefit: If the insured person does not claim the full benefit in kind to which he/she is entitled, a proportionate nursing allowance is paid at the same time. Carer's substitute: If the carer is temporarily unable to ensure the care because of a holiday, sickness or other reasons, the costs of providing a substitute are taken over for a maximum of four weeks and up to the amount of DEM 2,800 (EUR 1,432) per year.</p> <p>Partially residential care: As a supplement to domiciliary care, the care in institutions providing care during day and night is paid up to the value of DEM 750 (EUR 383), DEM 1,500 (EUR 767) or DEM 2,100 (EUR 1,074) per month. If the insured person does not claim the full amount of the benefit in kind, he/she is entitled to a proportionate nursing allowance. Short-time care: Provided that there is no other possibility to ensure domiciliary care, the costs of accommodation in a residential institution are taken over for a maximum of 4 weeks and up to DEM 2,800 (EUR 1,432) per year during the transitional period following to an in-patient treatment or if the carer is unavailable.</p> <p>In-patient care: from 1.1.1998 the costs for care, for medical treatment and also for social assistance will be covered depending on the care level at DEM 2,000 (EUR 1,023), DEM 2,500 (EUR 1,278), or DEM 2,800 (EUR 1,432), in extreme cases the sum increases to DEM 3,300 (EUR 1,687).</p>
---	---	--	--	---	---

E	<p>Beneficiaries pay 40% of the price of medicaments. There is a 10% reduction of the price for certain special medicaments, with a maximum limit of ESP 439 (EUR 2.64).</p> <p>No charge whatsoever for: pensioners, patients undergoing residential hospital care, residents over 65 years of age with insufficient means of existence, as well as conscientious objectors performing social work.</p>	<p>Provision and normal replacement of prosthesis, orthopaedic apparatus and wheelchairs free of charge.</p> <p>Grants may be made towards spectacles, hearing aids and other special types of prosthesis.</p>	<p>Comprising extractions and certain types of treatment. Certain financial aids for dental prosthesis. In the event of an employment injury or in the case of an occupational disease, oral and facial surgery are also covered.</p>	<p>Transport to hospital for sick people, in emergencies and under other special circumstances.</p>	<p>Precautionary measures.</p> <p>Thermal baths possible under certain conditions.</p>	<p>Home help for retired people, invalids, the mentally handicapped, etc.</p>
DK	<p>Cost to insured according lists of products:</p> <p><i>Very important products</i>: 25% of cost;</p> <p><i>Less important products</i>: 50% of cost.</p> <p><i>Insulin</i>: No charge to the insured person.</p> <p>For each category, the proportion of the cost payable by the insurance schemes is calculated with reference to two similar medicines on the market at the lowest end of the price scale.</p>	<p>Partial reimbursement</p>	<p>Cost to insured person in both categories:</p> <p>From 35% to 60% of cost of treatments on list. 100% for treatment not included in the list.</p> <p>Treatment is free for children and partially covered for handicapped persons.</p>	<p>Free transport to doctor or hospital for pensioners who are insured in Category 1, and in certain other cases and circumstances.</p>	<p>(same for hospitalisations)</p>	<p>For both categories of insured persons, share of cost met for treatment by chiropractor, physiotherapist or psychologist to whom the general practitioner has referred the insured.</p> <p>Free assistance and treatment given by nurse at home if recommended by a doctor.</p>

EL	<p>Charge of 25% for medicines prescribed by doctor.</p> <p>10% contribution towards cost of medication prescribed for certain illnesses (Parkinson's disease, Paget's disease, Crohn's disease, etc.).</p> <p>10% contribution towards cost of medication for retired persons receiving the minimum pension.</p> <p>No charges payable in the event of an employment accident, for medication during pregnancy and for chronic illnesses (cancer, diabetes etc.).</p>	Charge limited to 25 % maximum.	As for health care but charge of 25 % for dental prosthesis.	Cost of travelling for the sick living in distant regions, subject to certain conditions.	Partial contribution by the insured.	-
L	<p>Reimbursement according classification of drugs:</p> <p><i>Normal reimbursement: 80%</i></p> <p><i>Preferential reimbursement: 100%</i></p> <p><i>Reduced reimbursement: 40%</i></p> <p>Non-refundable products and drugs.</p>	Subject to sickness fund's prior approval: Refunds at the tariff rates fixed by agreements.	<p>Comprising preventive and conservative treatment, extractions, orthodontic treatment, and prostheses. Refund of tariffs as established in the collective agreements.</p> <p>80% reimbursement in excess of an annual sum of LUF 1,335 (EUR 33) which is fully covered. Prostheses are 100% covered, unless</p> <p>the insured person did not regularly consult a dentist, in which case patient's participation is 80%. Supplements for prostheses and benefits are for necessary treatment only, any extra treatment is not covered.</p>	Transportation cost reimbursable under certain conditions.	Subject to approval.	-

<p>IRL</p>	<p>No charge for persons with full eligibility.</p> <p>For those with limited eligibility, a refund of expenses over IEP 90 (EUR 114) per quarter. Persons suffering from a long-term condition are obliged only to pay IEP 32 (EUR 41) per month. No charge for persons suffering from mental handicap and mental illness (for persons under 16 years only) and from specified long-term illnesses in respect of drugs prescribed for treatment.</p> <p>A new drugs payment scheme will be introduced from the 1st March 1999, whereby no individual or family will have to pay more than IEP 42.00 (EUR 53) per month for prescribed medicines.</p>	<p>No charge for persons with full eligibility and for children under 6 years of age and national school pupils.</p> <p>Limited charges only levied on insured persons who satisfy certain contribution conditions.</p>	<p>No charge for persons with full eligibility, children under 6 years of age and persons who attend national school up to the age of 14 years.</p> <p>No charge for insured persons who satisfy certain contribution conditions for scalings, examinations, and polishing.</p> <p>Limited charge for fillings, extractions and other services.</p>	<p>Free transport to hospital, subject to certain conditions.</p>	<p>Health examination service for pre-school children and pupils of national schools.</p> <p>All necessary follow-up services for defects discovered at such examinations.</p> <p>A national screening service for scoliosis.</p> <p>Immunisation, diagnostic and hospital services for infectious diseases available without charge to all.</p>	<p>Hospital in-patient and out-patient services are provided free of charge for children suffering from certain long-term diseases and disabilities, women receiving maternity services, children up to six weeks of age and children referred from child health clinics and school health examinations.</p> <p>Free home help service, subject to certain conditions.</p>
-------------------	---	---	---	---	--	--

I	<p>Classification of medication into three groups:</p> <p><i>Group A:</i> Medication termed essential for the treatment of more serious complaints: Free for all insured persons.</p> <p><i>Group B:</i> Medication for the treatment of serious complaints but less serious than those referred to in group A: Free of charge for some categories of persons as mentioned under item Patient's contributions towards medical expenses and for the disabled. The rest of the population pays half price.</p> <p><i>Group C:</i> Other medication and medication for which a prescription is not required: The cost is borne fully by the insured person.</p> <p>Each prescription may not include more than 2 items. The patient is expected to contribute ITL 4,000 (EUR 2.07) for the prescription of 1 item and ITL 6,000 (EUR 3.10) for the prescription of 2 items; only the 100% disabled are exempt from making a contribution. and all medication essential for the treatment of very serious illnesses.</p>	No benefits.	Free treatment in the centres of the National Health Service and from registered doctors.	No benefits.	<p>Thermal cures: subject to prior approval of the local health unit.</p> <p>Participation: ITL 6,000 (EUR 3.10) for the prescription, plus 50% of fixed rates, with a maximum of ITL 70,000 (EUR 36) for each course of treatment.</p>	-
---	--	--------------	---	--------------	---	---

<p>A</p>	<p>Coverage of expenses for medically prescribed registered pharmaceutical products included in the List of Pharmaceutical Products (others: approved by medical superintendent or supervisory medical doctor). The charge amounts to ATS 44 (EUR 3.20) per item prescribed (free of charge for notifiable infectious diseases or in case of need).</p>	<p>Insured person's contribution 10%, minimum ATS 281 (EUR 20) (free of charge in case of need). The maximum amount to be covered by the insurance funds amounts up to ATS 14,049 (EUR 1,021) for prostheses up to ATS 35,121 (EUR 2,552) according to the statutes of the insurance funds.</p>	<p>Dental treatment and (indisposable) dental prosthesis are granted according to the statutes. Medical treatment includes conservative, surgical and orthodontic treatments. The patient's or family member's contribution towards orthodontic treatment and removable dental prosthesis such as braces is between 25% and 50%. As of 1.1.1997 a contribution amounting to ATS 50 (EUR 3.63) is to be paid for each dental treatment certificate, except in the case of children, pensioners and the needy). For extra treatment and services (e.g. inlays and crowns) the insurance fund's subsidy is between ATS 325 (EUR 24) and ATS 2,960 (EUR 215) per unit.</p>	<p>Expenses for transport, refund of travel expenses.</p>	<p>May be granted if necessary (in institutions of the insurance funds, contract institutions or in the form of supplements). Contribution amounts to between ATS 76 (EUR 5.52) and ATS 194 (EUR 14) per day and lasts for a maximum of 28 days per calendar year. The needy are exempt from participation.</p>	<p>Examinations of young persons, preventive examinations, mother-and-child examinations, medical care at home (medical benefits following the doctor's orders, provided by qualified staff, for a maximum of 4 weeks), psychotherapy.</p>
<p>P</p>	<p>Depending on type of illness, the state contributes 70% or 40% of the cost of the health services. These percentages are increased by 15% for pensioners whose pensions are less than the minimum wage.</p>	<p>80 % charge for prosthesis on the official list. Spectacles under health service prescription: 75 % charge for spectacles (contact lenses if certified necessary by doctor). Spectacles prescribed by specialists in private practice: Paid for by patient subject to 75 % reimbursement on prices according to official scale.</p>	<p>Medical treatment in health centres. Reimbursement by health service in line with scale laid down by government, in the event of recourse to private health services. Dental prosthesis prescribed by Health Service: benefit of 75 % of the price of the dental prosthesis according to scale. Dental prosthesis prescribed by private specialist: Fees paid by patient. Refund of 75 % of the fee according to official scale.</p>	<p>Payment of travel costs for patients living in remote areas, subject to certain conditions.</p>	<p>Reimbursement of cost of treatment in thermal centres in line with prevailing official scale, after receiving permission.</p>	

FIN	<p><i>Public hospitals:</i> Costs included in fee.</p> <p><i>Sickness insurance:</i> Patient's own liability is FIM 50 (EUR 8.41) + 50% of excess amount for products prescribed by a doctor. In serious and chronic diseases a number of listed pharmaceutical products qualify for refunds of 75% or 100% of the costs exceeding FIM 25 (EUR 4.20). If patient's own costs for pharmaceutical products during one calendar year exceed FIM 3,283 (EUR 552), the excess amount is fully reimbursed.</p>	<p><i>Health Centre:</i> In certain cases free of charge.</p> <p><i>Sickness Insurance:</i> Not refundable.</p>	<p><i>Health Centre:</i> The patient normally pays a fee according to a basic fee and a fixed tariff for each intervention. Health Centres are allowed to fix their tariff within certain limits. They are all lower than those by private dentists. Persons under the age of 19 and war veterans receive dental treatment free of charge.</p> <p><i>Sickness insurance:</i> Dental expenses are partly refunded to persons born in 1956 or thereafter. For examination and preventive treatment, the rate of refund is 75% and for other treatment 60% of the fee up to a specified limit. No refund is provided in respect of ortho- and prosthodontic treatment.</p> <p>For other persons costs for dental treatment are partly refunded only if the care was needed for the treatment of a disease other than the dental one. In addition, costs for examination and preventive treatment are refunded to persons born 1955 or before that, once in every three calendar years.</p>	<p>Travel and transport costs are fully compensated from the sickness insurance after deduction of patient's own liability of FIM 45 (EUR 7.57).</p> <p>If the patient's share of travel costs during the same calendar year is more than FIM 900 (EUR 151), the excess amount is fully refunded.</p> <p>Accommodation is refunded up to a maximum of FIM 120 (EUR 20) per night.</p>	<p>See patients' participation.</p>	<p>-</p>
------------	--	---	---	---	-------------------------------------	----------

<p>S</p>	<p>The patient pays the whole cost up to and including SEK 400 (EUR 42). Costs between SEK 401 (EUR 42) and SEK 1,200 (EUR 127) are subsidised by 50%. Costs between SEK 1,201 (EUR 127) and SEK 2,800 (EUR 296) are subsidised by 75%. Costs between SEK 2,801 (EUR 296) and SEK 3,800 (EUR 401) are subsidised by 90%. Costs above SEK 3,800 (EUR 401) are subsidised totally.</p>	<p>The county councils provide appliances on certain conditions.</p>	<p>For children up to 20 years of age dental care is free of charge in the public dental care. A new system of dental care subsidies is introduced from 1 January 1999. Free pricing is introduced for dentists and dental hygienists. For basic treatment the insurance pays a fixed amount to the dentist and the individual the remaining costs. The amount from the insurance corresponds to 30% of the tariff valid for 1998. For prosthetic treatment and orthodontic treatment there is a limit for high costs, where the insurance pays double the fixed amount for basic care reduced by SEK 3,500 (EUR 370) and the individual pays the rest.</p>	<p>Reimbursement for transportation costs on certain conditions.</p>	<p>See Hospitalisation.</p>	<p>Limitations for high costs. When a person within a 12 months period has costs for public health and medical care the limit is a maximum of SEK 900 (EUR 95). For pharmaceutical products the limit is SEK 1,300 (EUR 137) for a period of 12 months.</p>
-----------------	--	--	--	--	-----------------------------	---

<p>UK</p>	<p>Charge of GBP 5.80 (EUR 8.16) per prescribed item except for children under 16, people aged 16-18 and still in full-time education, people aged 60 or over, pregnant women and women who have had a baby within the last 12 months, War Pensioners (for their accepted disability), persons receiving Income Support, income based Jobseeker's Allowance, Family Credit or Disability Working Allowance and their partners, some other people on low incomes, and people suffering from specified conditions.</p> <p>An annual (or 4 months) season ticket can be bought entitling the holder to an unlimited number of prescribed items without charge in the period of its validity. The cost of the ticket is GBP 30.10 (EUR 42) for 4 months and GBP 82.70 (EUR 116).</p>	<p>Spectacles: No spectacles supplied free.</p> <p><i>Vouchers available to help with purchase of spectacles for certain groups:</i> to children under 16 or under 19 and still in full-time education, or people receiving income-based Jobseeker's Allowance, Income Support, Family Credit or Disability Working Allowance and their partners. Also for those on low incomes or requiring complex lenses; also War Pensioners (for their accepted disability) and Hospital Eye Service patients.</p> <p>No charge for sight tests for the above categories, plus registered blind or partially sighted, diagnosed diabetic or glaucoma patient, or aged 40 or over and the brother, sister, parent or child of a diagnosed glaucoma patient. Others pay privately.</p> <p><i>Prosthesis and hearing-aids:</i> No charge for provision and fitting of National Health Service appliances.</p>	<p><i>Proportional charges for NHS dental treatment in the General Dental Service, including examination. 80% of cost of a course of treatment up to a maximum of GBP 340 (EUR 478).</i></p> <p>No charge for women who are pregnant, or who have had a baby in the preceding 12 months, when the course of treatment starts, people under 18; those under 19 in full-time education; people receiving income support, or income-related job seekers allowance, family credit or disability working allowance and their partners.</p> <p>People on a low income may be able to get help with the cost of treatment.</p> <p>Dental treatment in the hospital and Community Dental services, however, is free except for dentures and bridges.</p>	<p>Various additional benefits provided under the National Health Service and by local authorities, e.g. free transport to hospital, or in cases of medical need, reimbursement of hospital travelling costs in certain cases.</p>	<p>No charge, except where the patient asks for special amenities or for extra treatment which is not clinically necessary.</p>
